Gapi Group

Nato nel 1962, GAPI Group ha sede in Italia, a Castelli Calepio, Bergamo.

Specializzato nella realizzazione, distribuzione e vendita di una gamma completa di **soluzioni di tenuta**, GAPI Group oltrepassa i 100 milioni di Euro di fatturato annuo e impiega oltre 700 addetti distribuiti su 12 siti produttivi e 6 unità logistiche.

Grazie al coordinamento di **11 divisioni interne** specializzate nella progettazione e realizzazione di differenti articoli tecnici in materiali quali gomma, gomma metallo, termoplastici, poliuretani, PTFE e tecnopolimeri, e alla disponibilità di differenti tecnologie produttive, di sofisticati laboratori di analisi e centri di ricerca e sviluppo, GAPI Group è in grado di offrire soluzioni per tutte le principali esigenze applicative con un concetto di **total sealing**.

Established in 1962, the GAPI Group is based in Castelli Calepio, Bergamo, Italy.

*GAPI Group specializes in the manufacturing, distribution and sale of a complete range of **sealing solutions**. The group has an annual turnover of more than 100 million Euros and employs over 700 people, working in **11 production plants** and 6 logistical facilities.*

Ten divisions coordinate the design and manufacture of technical products in rubber, rubber-metal, thermoplastics, polyurethanes, PTFE and other technical polymers. R&D centres support the diversified manufacturing technologies with vanguard analysis, and product and material development laboratories.

*Through the business concept of "**Total Sealing**", the GAPI Group provides value by offering a broad range of technical solutions through localized logistical support and service.*

Technical overview

Oleodinamica e pneumatica

Discipline consolidate della fluidodinamica, l'oleodinamica e la pneumatica sono orientate allo studio della trasmissione dell'energia tramite fluidi in pressione. La risoluzione di un problema in tali ambiti comporta generalmente lo sviluppo di complesse equazioni per definire proprietà del fluido come velocità, pressione, densità e temperatura in funzione di spazio e tempo. Grazie ai numerosi vantaggi e alla capacità di combinare formidabili concentrazioni di potenza con eccellenti capacità di controllo e regolazione, l'oleodinamica e la pneumatica risultano vincenti in moltissime applicazioni.

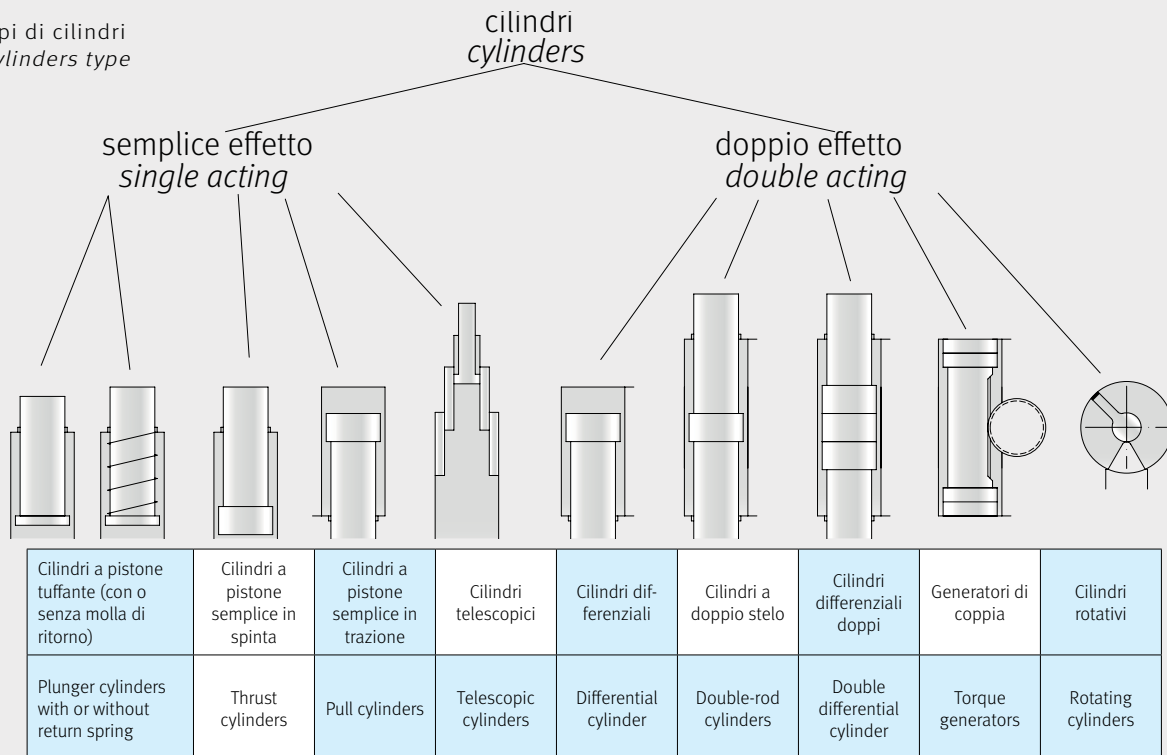

Nella tipica applicazione oleodinamica, la portata di olio generata da una pompa all'interno di un circuito oleodinamico è utilizzata per muovere un martinetto o un motore idraulico a seconda che l'effetto meccanico desiderato (forza o movimento) sia lineare o rotatorio. I cilindri oleodinamici sono attuatori lineari che convertono l'energia idraulica in meccanica generando forza e lo spostamento

Hydraulics and pneumatics

Hydraulics and pneumatics are very well-established branches of fluid dynamics, focusing on the study of energy transmission through fluids under pressure. Solving a problem in such fields usually implies the development of complex formulas, aiming at specifying the different fluid properties, such as for instance speed, pressure, density and temperature, as a function of space and time. Thanks to their countless advantages, those technologies are applied very successfully in a large number of mechanical engineering applications, as they combine outstanding concentrations of power with excellent control and adjustment capabilities.

In a typical hydraulic application, the oil flow generated by a pump in a hydraulic circuit is used to move a jack or a hydraulic motor to obtain the desired mechanical effect (force or movement), i.e. linear or rotational movement. Hydraulic cylinders are linear actuators converting hydraulic into mechanical energy, that generate a force and determine the linear displacement of the

Fig.1: tipi di cilindri
cylinders type

lineare del carico. In base alla funzione svolta sono a semplice o doppio effetto, secondo lo schema riportato.

All'interno di tali cilindri si fa largo impiego di guarnizioni, anelli realizzati in materiali elastomeri o termoplastici di sezione variabile che garantiscono la tenuta dei fluidi tra parti mobili e fisse in un ampio contesto di casistiche e applicazioni. Negli ultimi anni l'imporsi di condizioni di esercizio sempre più gravose e l'impiego di fluidi tecnologicamente evoluti hanno portato alla nascita di guarnizioni sempre più performanti. I nuovi polimeri in particolare, combinati a profili innovativi, riescono a garantire i risultati desiderati.

In tali contesti, le guarnizioni devono resistere principalmente alle pressioni, alle temperature e alle velocità di esercizio e risultare compatibili al contatto con determinati fluidi. Inoltre, per garantire il buon funzionamento nel tempo, devono avere una buona resistenza all'usura. Le guarnizioni devono quindi possedere elasticità, resistenza alla compressione e all'usura, durezza e compatibilità chimica con il fluido.

In sintesi, i fattori che influenzano l'intero sistema di tenuta in un cilindro sono molteplici e vanno considerati fin dalla progettazione delle guarnizioni che devono essere realizzate in stretta collaborazione con il produttore scegliendo i materiali più idonei e progettando i profili più adeguati. Solo così si otterranno sistemi di tenuta efficaci e affidabili nel tempo.

load. Depending on the function to be carried out, hydraulic cylinders can be grouped into two main categories: single-acting cylinders and double-acting cylinders, as shown in the diagram below.

Cylinders use a large number of seals, i.e. rings in elastomeric or thermoplastic materials with variable section, that shall guarantee the flawless sealing of fluids among the cylinder reciprocally movable and fixed parts, in a wide range of situations, mainly determined by the different application requirements.

In recent years, the introduction of new fluid types, as well as the fluid steadily increasing pressure and temperature levels, led to the development of new seal types, able to guarantee adequate performance standards. In particular, new polymers have been developed, that combined with innovative profiles enable to achieve the expected results.

Seals shall primarily withstand operating pressures, temperatures and speeds and offer compatibility with given fluids. Moreover they shall feature good wear resistance properties, in order to ensure efficient operating over time. Therefore, they shall offer elasticity, compressive strength, wear resistance, hardness and chemical compatibility with fluids.

As a result, the factors influencing the entire sealing system in a cylinder are many and shall all be taken into serious consideration right from the seal design phase, choosing the most suitable materials and designing the most effective profiles. The co-operation between the seals producer and the end user becomes then essential to develop efficient and reliable sealing systems in time.

Condizioni di esercizio

Operating conditions

Pressione

Nelle condizioni di esercizio la pressione gioca un ruolo fondamentale. Pressioni troppo elevate combinate con giochi di accoppiamento eccessivi tra stelo/testata e camicia/pistone rappresentano, nel medio termine, il primo motivo di deterioramento della guarnizione causato dall'estrusione con conseguenti perdite di fluido. Pressioni variabili, improvvise e di valore altissimo, provocate da fattori esterni e situazioni anomale, possono invece sottoporre le guarnizioni a forti shock e provocare lacerazioni e crepe capaci di compromettere l'intero sistema idraulico.

Anche l'assenza di pressione, o la prossimità allo zero, influisce negativamente su tutto il sistema. In questo caso è altrettanto complesso garantire la tenuta perfetta, affidata principalmente al modulo elastico del materiale della guarnizione e al suo profilo, disegnato affinché il precarico iniziale di montaggio risulti efficace alla tenuta anche in assenza di pressione, laddove manchi il supporto pressorio per mantenere i labbri della guarnizione contro la superficie di contatto. In questi casi si richiede l'impiego di tenute specifiche.

L'ampia scelta di profili Artic Seals, abbinati a materiali come poliuretani, gomme e polimeri in PTFE, consentono di individuare la soluzione ideale in tutte le applicazioni.

Temperatura

La temperatura del fluido da trattenerne influisce profondamente su vita ed efficienza della tenuta. Alla temperatura propria del fluido è necessario sommare una sovratemperatura provocata dall'attrito tra lo spigolo di tenuta della guarnizione e la superficie di contatto.

Pressure

Too high pressure values combined with excessive fitting clearance values between rod/head and liner/piston are the main cause of seals deterioration due to extrusion in the medium run, resulting in fluid leakages. Besides the typical operating pressure generated by the hydraulic system, other pressures may occur in cylinders: variable, unexpected and extremely high.

This happens when a machine supplied with hydraulic cylinders experiences anomalies and heavy-load events due to external factors. The resulting pressure peaks adversely affect the entire system, exposing the seals to heavy shock loads, that may cause tears or cracks and damage the whole hydraulic system.

Another condition negatively affecting the entire system is the lack of pressure or a pressure close to zero.

Also in that case, it is very complicated to ensure a flawless sealing, that will be basically left to the modulus of elasticity of the seal material and to its profile, conceived to ensure an effective initial mounting preload for the seal even in lack of pressure, where no pressure support is available to keep the seal lips against the contact surface. In those cases it would be appropriate to use specific seals.

The proposed product range offers a wide choice of profiles, which combined with different material typologies such as polyurethanes, rubbers and polymers of PTFE, enable to identify the ideal solution for any application.

Temperature

The temperature of the fluid to be retained has a major influence on the life and, therefore, the efficiency of the seal. Moreover an over temperature, that results from the friction between the seal lip and the contact surface, shall be added to the fluid own temperature.

L'entità della sovratemperatura dipende principalmente da:

- rugosità di stelo e camicia
- velocità
- pressione d'esercizio
- tipo di fluido da ritenere
- lubrificazione
- forma del labbro di tenuta
- anelli di guida.

La resistenza di una guarnizione alla somma delle temperature coinvolte è garantita dal materiale di realizzo. E per ogni tipologia di materiale esistono temperature tipiche di esercizio che possono variare notevolmente in funzione del profilo della guarnizione.

Quando ci si avvicina alle temperature limite individuate per ogni tipologia di guarnizione, possono comparire problemi sia alle basse sia alle alte temperature, poiché in entrambe le situazioni la viscosità del fluido e l'elasticità del materiale variano vistosamente. Alle alte temperature, per esempio, l'eccessiva viscosità può compromettere il potere lubrificante del fluido, basilare per mantenere il microfilm di olio che si crea tra il labbro di tenuta e la superficie di scorrimento. Il film lubrificante è in funzione della pressione idrodinamica generata dalla velocità del sistema e, in sua assenza, l'attrito derivato innalza rapidamente la temperatura della guarnizione. Il rischio è di assistere a una variazione di stato dell'elemento di tenuta, in base alla composizione del materiale, alla forma e alla durezza. Alle basse temperature invece la guarnizione si irrigidisce, con notevole perdita di elasticità, fino a giungere a un vero e proprio cambiamento di stato quando si tocca la temperatura di cristallizzazione del materiale di realizzazione, detta appunto transizione vetrosa.

Artic Seals propone una gamma di profili e materiali adatti ad applicazioni con un range di temperature molto ampio e compreso tra -50°C e $+220^{\circ}\text{C}$. Le temperature indicate nelle schede tecniche dei materiali sono puramente indicative in quanto testate su provini e in ambiente controllato.

The over temperature values depend on different factors, the main ones being:

- *rod and bore roughness*
- *speed*
- *operating pressure*
- *fluid to be retained*
- *lubrication*
- *sealing lip shape*
- *wear rings.*

Considering all temperatures involved, the main item that determines the seal resistance is the material it is made of. For each material type, typical operating temperatures are taken into consideration, that can vary considerably depending on the seal profile.

When getting closer to the limit temperatures of a given seal type, problems may arise both at high and low temperature, as significant changes in the fluid viscosity and material elasticity occur in both conditions.

At high temperatures, for example, the excessive fluid viscosity may damage its lubrication efficiency, which is essential to maintain the oil microfilm that forms between the sealing lip and the sliding surface.

The lubricant film is a function of the hydrodynamic pressure generated by the system speed and in lack of it, the resulting friction causes the seal temperature to raise in short time.

The risk is then to experience a change in the sealing item state, depending on the material, shape and hardness.

At low temperatures, the seal may stiffen losing a considerable share of its elasticity properties, up to a real change of state when it reaches the material crystallization temperature, specifically known as glass transition.

Artic Seal proposes a wide assortment of profiles and materials, suitable for applications with temperature between -50°C and $+220^{\circ}\text{C}$. Please note that the temperatures listed in the material technical data sheets are to be regarded as guideline values, as they are tested on specimens in a controlled environment.

Velocità

Parlando di velocità nelle condizioni di esercizio ci sono alcune variabili da considerare: la rugosità delle superfici di contatto, la temperatura dell'olio e la pressione d'esercizio. Queste tre variabili, insieme al tipo di materiale della guarnizione, possono determinare il valore massimo della velocità sostenibile dal sistema. Velocità comprese tra 0,03 e 0,3 m/s normalmente non compromettono il funzionamento del sistema di tenuta. In presenza di velocità molto basse, invece, la modesta pressione idrodinamica non riesce a mantenere costante lo spessore del meato d'olio che si crea tra i labbri della guarnizione e la superficie di scorrimento. Esso tende a rompersi e ricrearsi in continuazione e l'attrito che ne deriva genera un movimento a scatti (stick slip) con conseguente usura della guarnizione. Al contrario, a velocità troppo elevate la pressione idrodinamica tende a staccare il labbro di tenuta dalla superficie di contatto. In questa zona aumenta la temperatura e diminuisce la viscosità del fluido con la conseguente perdita.

Fluidi

In un cilindro idraulico si utilizzano normalmente oli a base minerale o ecologici biodegradabili. Le caratteristiche di ciascun tipo di fluido sono abitualmente vagliate da produttore e utilizzatore finale in base a esigenze specifiche (v. tabella 1).

Un aspetto molto importante da valutare è la compatibilità del fluido, olio in particolare, con le guarnizioni di tenuta. In caso di lubrificanti nuovi, poco utilizzati o mai testati, Artic Seals si rende disponibile a verificarne la compatibilità con le proprie guarnizioni presso la sala prove aziendale.

Speed

When it deals with speeds, some other variables shall be taken into consideration, i.e. the contact surface roughness, the oil temperature and the operating pressure.

These three variables together with the seal material may determine the system maximum admissible speed. Speeds in the range between 0,03 and 0,3 m/s, normally, do not affect the sealing system efficiency. In case of very low speeds, however, the poor hydrodynamic pressure is unable to maintain constant the thickness of the oil gap that forms between sealing lips and sliding surface. It tends to break and reform continuously and the resulting friction causes a "jerky" motion (stick-slip), leading to the seal wearing. On the contrary, at too high speeds the hydrodynamic pressure tends to "pull" the sealing lip away from the contact surface. In this area the temperature increases, while the fluid viscosity decreases, resulting in leakages.

Fluids

Hydraulic cylinders normally use mineral-base oils or biodegradable, environmentally friendly ones. The features of each fluid type are usually weighed by the manufacturer and the end users, depending on the specific needs. (See Table 1)

Hydraulic cylinders normally use mineral-base oils or biodegradable, environmentally friendly ones. The features of each fluid type are usually weighed by the manufacturer and the end users, depending on the specific needs. Below are listed the hydraulic oils on the market:

Condizioni di esercizio

Operating conditions

ARTIC SEALS

Tab. 1 - principali olii idraulici presenti sul mercato - *Principal Hydraulic oils on the market*

Liquidi a base di olio minerale/ <i>Mineral-oil based fluids</i>	Liquidi resistenti alla fiamma/ <i>Fire resistant fluids</i>	Liquidi ecologici / <i>Environmentally friendly fluids</i>	Liquidi speciali / <i>Special fluids</i>
HL Con additivi Anticorrosione e anti-vecchiamento / <i>With anticorrosion and anti-aging additives</i>	Acqua pura / <i>Pure water</i>	HETG Trigliceridi a base di oli vegetali (Olio di colza) / <i>Vegetable-oil-based tryglicerides (rapeseed oil)</i>	Liquidi sintetici per usi aeronautici / <i>Synthetic fluids for aeronautical use</i> MIL-H-5606A
HLP Come HL più additivi antigrippaggio / <i>Like HL plus anti-seize additives</i>	HFA Emulsione olio in acqua / <i>Oil-in-water emulsion</i> (80-98 % O)	HEPG Glicoli polietilenici e polialchilenici / <i>Polyethylene and polyalkylene glycols</i>	Liquidi sintetici per usi marini / <i>Synthetic fluids for marine use</i> NATO-H-540
HV Come HLP più additivi riduzione viscosità con la temperatura / <i>Like HLP plus additives reducing viscosity with temperature</i>	HFB Emulsione acqua in olio / <i>Oil-in-water emulsion</i> (40-50 % O)	HEE Esteri sintetici / <i>Synthetic esters</i>	
HLP-D Come HLP più additivi detergenti / <i>Like HLP plus detergent additives</i>	HFC Poliglicole in soluzione acquosa / <i>Polyglycole in water solution</i> (35..55 % O)		
	HFDR Esteri forforici / <i>Phosphate esters</i>		
	HFDS Idrocarburi clorati / <i>Chlorinated hydrocarbons</i>		
	HFDT Miscele di HFDR+HFDS / <i>HFDR+HFDS compounds</i>		

Tab. 2 - principali olii idraulici presenti sul mercato - *Principal Hydraulic oils on the market*

ISO classification	Sub Category	Composition	Wear Content	Typical Temperature Range (ISO)	Comments
HFA	HFAE	oil in water emulsion	>80%	+5 to +50 °C	Storage temperature >0°
	HFAS	Synthetic aqueous fluids	>80%	+5 to +50 °C	
HFB	-	Water-in-oil (invert emulsion)	> 40%	+5 to +50 °C	Storage temperature >0°
HFC	-	Water glicole solutions	> 35%	-20 to +50 °C	-
HFD	HFDR	Phosphate esters	None	-20 to +70°C	In some case, used up to 150°C but a such temperatures, the fluids may be subject at deterioration and shall be frequently checked (upper temperature limits for short-term only). In high-temperature circuits, i.e. above +100°C, special materials may have to be used for seals, packings, hoses etc. Where doubt exist, clarification should be sought from the equipment manufacturer and / or fluids.
	HFDU	Synthetic Anhydrous fluids other than phosphate esters (PAG / Polyol esters)	None	-20 to +70°C

Classificazione e denominazione dei materiali Artic Seals

Classification and designation of Artic Seals materials

Materiali

Nel determinare la guarnizione ideale per una specifica applicazione, la scelta del materiale è l'aspetto più importante e complesso poiché bisogna orientarsi tra una moltitudine di polimeri.

Il materiale va selezionato anche sulla base dei vincoli previsti da ogni sistema di tenuta.

Tra i più significativi vi sono:

- compatibilità chimica tra la tenuta e il fluido o l'ambiente lavorativo
- attrito/usura: indispensabile per determinare la vita e le prestazioni della tenuta
- proprietà meccaniche: definiscono la resistenza del materiale alle sollecitazioni meccaniche
- resistenza all'estrusione: definisce i limiti meccanici del materiale
- assemblaggio, stoccaggio e movimentazione, indispensabili per preservare le caratteristiche delle tenute.

Di seguito i polimeri più utilizzati in ambito guarnizioni.

Materials

To determine the most suitable seal for a specific application, the material choice is for certain one of the most important issues and perhaps the most complex one, due to the variety of polymers currently available on the market. Moreover, the material shall be accurately selected based on the binding requirements specified for the sealing systems. Among them, the most important are the following ones:

- *chemical compatibility: contact seal material and the fluid used and/or the operating environment*
- *friction/Wear: It is essential to evaluate the seal life and performances*
- *extrusion resistance: It is essential to evaluate the material suitability*
- *information assembling: storing and handling methods. Essential to maintain the seal performance.*

Checking the sealing system main features, that may impact on the seal material, makes the material selection much easier and effective. Find below a brief overview of the polymers most commonly used for seal manufacturing.

Tab. 4 - THERMOPLASTIC ELASTOMERS - POLIURETHANES : TPU

Artic Seals Code	Description	Colour identification	Typical Applications & Description	Service Temperature Range °C (F°)	Shore Hardness	
					A	D
AO	Polyether copolymer-based TPU	Light Violet	Combines hardness with excellent mechanical properties and good hydrolysis resistance. Ideal for Pneumatic applications like rod seals, piston seals and wipers	-40 to +90	85	
AT	Virgin Polyether copolymer-based TPU	Transparent	Combines low hardness with excellent mechanical properties and good hydrolysis resistance. Ideal for Pneumatic applications like rod seals, piston seals and wipers.	-40 to +90	85	
AG	Graphite Filled Polyether copolymer-based TPU	Graphite Grey	Combines hardness with excellent mechanical properties and good hydrolysis resistance. Improved wear resistance and reduced friction compared with standard Ao TPU.	-40 to +90	85	
Bo	polyether-based thermoplastic polyurethane	Light Grey	Exceptional performance in terms of compression set, wear resistance and hydrolysis resistance. Excellent Pneumatic rod seals, piston seals and wipers	-40 to +90	90	
BT	Virgin polyether-based thermoplastic polyurethane	Transparent	Exceptional performance in terms of compression set, wear resistance and hydrolysis resistance. Excellent for hydraulic and Pneumatic seals, at very low temperature.	-45 to +90	90	
BG	Graphite Filled polyether-based thermoplastic polyurethane	Graphite Grey	Exceptional performance in terms of compression set, wear resistance and hydrolysis resistance. Improved wear resistance and reduced friction compared with standard Bo. Excellent for Pneumatic rod seals, piston seals and wipers.	-40 to +90	90	
Co	Caprolactone-based thermoplastic polyurethane.	Violet	Exceptional performance in terms of compression set, wear resistance and hydrolysis resistance over conventional polyester-based TPUs. Material produced by Kasting.	-35 to +110	94	
CT	Caprolactone-based thermoplastic polyurethane.	Transparent	Exceptional performance in terms of compression set, wear resistance and hydrolysis resistance over conventional polyester-based TPUs. Material produced by Kasting. Transparent version	-35 to +110	94	
Do	Polyester based thermoplastic polyurethane.	Fuchsia	Grease and oil-resistant; low compression set; good heat resistance, high elasticity, good for automotive engineering, technical parts and bearing bushes	-35 to +110	98	
Eo	Polyether based polyurethane	natural white	High antiextrusion resistance for antiextrusion ring, wipers and special applications. Better resistance to hydrolysis and microbiological attack, a very good cold flexibility but a lower resistance to oxidation, in comparison with Polyester TPUs.	-25 to +100		62
Go	PPDI isocyanate based thermoplastic polyurethane	Dark Grey	Offers a combination of properties not obtainable with MDI polyurethane based. Very low compression set at elevated temperatures (+135°C) , Resistance to abrasion, flex cracking, cutting and tearing, rebound resilience are all taken to a significantly higher level.	-30 to +135	93	
GT	Virgin PPDI isocyanate based thermoplastic polyurethane	Transparent	Offers a combination of properties not obtainable with MDI polyurethane based. Very low compression set at elevated temperatures (+135°C) , Resistance to abrasion, flex cracking, cutting and tearing, rebound resilience are all taken to a significantly higher level.	-30 to +135	93

Tab. 5 - THERMOPLASTIC ELASTOMERS: TPE

Artic Seals Code	Description	Colour identification	Typical Applications & Description	Service Temperature Range °C (F°)	Shore Hardness	
					A	D
L0	High performance thermoplastic polyester elastomer	Black	Dedicated to anti-extrusion rings and special parts requiring food contact compatibility. Food compliance specificity. It show extended resistance to extrusion and excellent fluid compatibility.	-55 to +110		37
L1	Thermoplastic polyester elastomer	Yellow	Mainly used for production of anti-extrusion rings. It show extended resistance to extrusion and excellent fluid compatibility.	-30 to + 130 (Peaks till -50 to +150)		55
L2	Thermoplastic polyester elastomer	Light violet	Mainly used for production of anti-extrusion rings. It show extended resistance to extrusion and excellent fluid compatibility.	-30 to + 130 (Peaks till -50 +150)		63
L7	Thermoplastic polyester elastomer	White	General purpose industrial parts, with extended resistance to extrusion and excellent fluid compatibility.	-30+ 130 (Peaks till -50 +150)		72
L9	Thermoplastic polyester elastomer	Natural	General purpose industrial parts, with extended resistance to extrusion and excellent fluid compatibility.	-55 to + 110		40

Tab. 6 - SYNTHETIC FLUOROPOLYMER: Polytetrafluoroethylene (PTFE)

Artic Seals Code	Description	Colour identification	Typical Applications & Description	Service Temperature Range °C (F°)	Shore Hardness	
					A	D
T1	PTFE Virgin	White	Wide temperature range, excellent sliding properties, good steam and hot water resistance; FDA approved.	-190 to +230		55 - 57
T3	PTFE fiber Glass Filled (15%), Graphite, MoS ₂ (3%)	Green	Developed for hydraulic piston seals, involved in extreme conditions such as high pressure, high temperature, wear resistance on hardened dynamic surfaces.	-190 +260		55 - 61
TM	PTFE Bronze Filled (40%)	Brown	High compressive load and extrusion resistance, ideal for hydraulic rod/piston seals.	-150 +260		58 - 65
TV	PTFE Bronze Filled (40%)	Green	High compressive load and extrusion resistance, ideal for hydraulic wearing.	-150 +260		58 - 65
TC	PTFE Graphite Filled (15%)	Black	High chemical and corrosive resistance, low abrasion for soft shaft. Self-lubricating properties, ideal for hydraulic wearing.	-190 +230		55
T4	PTFE Carbon Filled (10%)	Dark Grey	Good in water service, very high chemical resistance against strong alkali and hydrofluoric acid.	-190 +230		64 - 67

Tab. 7 - THERMOPLASTIC ENGINEERED RESIN: COMPOSITE RESIN

Artic Seals Code	Description	Colour identification	Typical Applications & Description	Service Temperature Range °C (F°)	Shore Hardness	
					A	D
S0	Phenol resin Cotton fabric reinforced	Tan	Self-lubrication, good mechanical properties, good dimensional stability and chemical resistance. Excellence in water resistance and in abrasion resistance. Excellence in impact. Main applications are wear ring for all kinds of cylinder, sliding bearing and bushes.	-60 to +150		80 (45)*
S1	Phenol resin polyester fabric reinforced with PTFE	Light blue	Self-lubrication, good mechanical properties, good dimensional stability and chemical resistance. Excellence in water resistance and in abrasion resistance. Excellence in impact. Main applications are wear ring for all kinds of cylinder, sliding bearing and bushes.	-60 +150		75 (45)*
S3	Phenol resin polyester fabric reinforced with GRAPHITE	Dark grey	Excellent dimensional stability and abrasion resistance. Self-lubrication and wide chemical resistance. Excellence in water. Main applications are wear ring for all kinds of cylinder, sliding bearing and bushes.	-50 +150		80 (45)*

Tab. 8 - THERMOPLASTIC ENGINEERED RESIN: POM- PA-PBT

Artic Seals Code	Description	Colour identification	Typical Applications & Description	Service Temperature Range °C (F°)	Shore Hardness	
					A	D
R0	POM homopolymer 20% glass fiber filled	Black	High stiffness, low warpage and low creep for superior performance at elevated temperature. It contains carbon black for improved weathering. Primary application is Hydraulic wearing.	-40°C to +115°C		85
R2	POM homopolymer Heat stabilized	White	Acetal homopolymer, with improved thermal stability, good mechanical properties, and low volatile emissions.	-40°C to +115°C		85
R2FG	POM homopolymer Food Grade	White	Food compliance specificity; Acetal homopolymer, with improved thermal stability. It has been developed for consideration into applications such as parts for the food industry.	-40°C to +115°C		85
R3	POM filled 10% PTFE/Silicone	White	Self-lubricating material, good wear resistance. Mainly used for pneumatic wearing. It shows high mechanical properties, low friction coefficient and low wear.	-40°C +115°C		84
R1	PA6 40% glass fiber filled	Black	The glass fiber reinforcement enhances performance such as strength, stiffness and heat deflection temperature. The heat stabilizer system extends the properties at elevated temperatures. It also has excellent chemical resistance to greases, oils and hydrocarbons	-40°C +140°C		86
R4	PA6 + MOS ₂	Dark Grey	Heat stabilized PA6 filled with MoS ₂ , ideal for hydraulic special items such as bushings, wipers and back-up rings where there is a demand for high toughness and low friction. Self lubricating compound.	-40°C +130°C		85
R6	PA66	White	Super tough polyamide 66 outstanding break resistance over a wide range of temperature and umidity range . Ideal for piston seal, bushing and back up ring.	-40°C +130°C		85
R7	PA66 30% glass fiber filled	Black	The glass fiber reinforcement enhances performance such as strength, stiffness and heat deflection temperature. The heat stabilizer system extends the properties at elevated temperatures. It also has excellent chemical resistance to greases, oils and hydrocarbons	-40°C +140°C		86
R9	PA6 40% glass fiber and 15% PTFE filled	Black	Heat stabilized PA6 40% glass fiber and 15% PTFE filled, ideal for hydraulic special items such as bushings, wipers and back-up rings where there is a demand for high toughness and low friction. . Self lubricating compound.	-40°C + 140°C		85 - 88
P2	Polibutilentereftalato (PBT)	White	PBT compound based filled with PTFE. It shows excellent self-lubricating properties. General purpose for industrial and meccanichal applications.	-30+ 130 (Peaks -50 +150)		72

Tab. 9 - THERMOSET ELASTOMERS : Nitrile (NBR)

Artic Seals Code	Description	Colour identification	Typical Applications & Description	Service Temperature Range °C (F°)	Shore Hardness	
					A	D
N0	NBR 70 Sh	Black	General purpose nitrile rubber, ideal for soft seals like standard Oring energizing element for PFTE sealing system	-30 +100	70	
N1	NBR 73 Sh	Black	General purpose nitrile rubber, ideal for soft seals like standard Qring and energizing element for PFTE sealing system	-30 +100	73	
N2	NBR 75 Sh	Black	General purpose nitrile rubber, with low compression set, good chemical compatibility and good modulus, ideal for pneumatic sealing system.	-30 +100	75	
N3	NBR 75 Sh	Black	General purpose nitrile rubber, with low compression set, good chemical compatibility and good modulus, ideal for pneumatic sealing system.	-35 +120	75	
N4	NBR 90 Sh	Black	Hard nitrile with high modulus and good compression set, for outstanding antiextrusion application.	-30 +100	90	
N5	NBR 80 Sh	Black	Premium nitrile, for use application where its required perfect sealing at low temperature.	-60 +100	80	

Tab. 10 - THERMOSET ELASTOMERS : Fluorocarbon Elastomer (FKM)

Artic Seals Code	Description	Colour identification	Typical Applications & Description	Service Temperature Range °C (F°)	Shore Hardness	
					A	D
FKM75	Fluoro-elastomer 75SH	Black / Brown	General purpose Fluorocarbon, strong resistance to chemical attack and heat	-25 + 200	75	
FKM 85	Fluoro-elastomer 85SH	Brown	General purpose Fluorocarbon, strong resistance to chemical attack and heat	-20 +200	85	

Tab.11- TPUs different based comparison

Parameter	Polyester based TPUs	Polycaprolactone based TPUs	Polyether based TPUs
Hydrolysis Resistance	-	+	++
Microbial stability	-	+	+
Adhesion strength	+	++	+
Thermooxidative resistance	+	+	+
Low temperature flexibility	0	+	++
Mechanical proprieties	+	++	+
Oil and grease resistance	+	++	+

(++ excellent; + good; 0 acceptable; - poor; -- very poor)

The above reported values are based on laboratory tests performed on specimen and reflected typical material properties. The application limits are maximum values determined in the laboratory. It is recommended that customers perform adequate testing to evaluate the suitability of each individual products.

PU – Poliuretano

Resina uretanica ampiamente utilizzata nel settore delle guarnizioni ottenuta tramite reazione tra poliolo, di-isocianato ed estensore di catena. Due le tipologie di poliuretani a seconda del tipo di poliolo di base: polietere e poliestere.

Differenti anche i tipi di di-isocianato. Tra i più utilizzati: MDI, PPDI e TODI. La combinazione tra tipologia di poliolo da un lato e di-isocianato dall'altro dà origine a prodotti eterogenei, le cui caratteristiche fisiche e meccaniche variano significativamente, così come le applicazioni di utilizzo.

TPE – Termoplastico elastomero

Il termoplastico elastomero è una resina poliestere disponibile in diversi gradi di durezza adatta ad applicazioni oleodinamiche, specialmente per anelli di supporto e anti-estrusione.

Materiale flessibile come gli elastomeri e dotato di proprietà meccaniche simili alle materie plastiche, ha ottima resistenza a taglio e abrasione ed elevate caratteristiche chimiche. È compatibile con oli lubrificanti, idrocarburi e molti fluidi come acidi e basi.

POM – Polimetilossido

Il polimetilossido, comunemente conosciuto come resina acetica, è utilizzato nella costruzione di boccole, anelli anti-estrusione e pattini di guida nei cilindri. Ha ottime proprietà di rigidità, elevata resistenza all'urto e alla fatica e un alto modulo elastico. Non essendo igroscopico ha ottima stabilità dimensionale e supporta, con o senza cariche aggiuntive, carichi radiali importanti.

Le molte versioni si differenziano tra loro per l'additivo introdotto e per la sua percentuale. Per esempio, il POM per le fasce di guida a contatto con superfici in acciaio è caricato con fibra di vetro, mentre si carica con PTFE per ridurre l'attrito.

PU – Polyurethane

Urethane resin increasingly used to manufacture seals. It is obtained by reaction among polyol, diisocyanate and a chain extender. In seals division, two main polyurethanes are used depending on the base polyol: polyether and polyester. Another important classification concerns the diisocyanate type, the most used being MDI, PPDI and TODI. The combination between polyol and diisocyanate typology results in very different products, whose physical and mechanical features vary significantly, as well as the applications they are intended for. The TPUs currently on the market are elastomers with high performing mechanical characteristics and featuring excellent tensile strength, as well as very good tearing, abrasion and cutting resistance; they are usually compatible with mineral oils, greases, hydrocarbons and petroleum derivatives. Standard TPUs normally feature a poor compatibility with hot water, acids, alkaline solutions, steam.

TPE – Thermoplastic elastomer

The thermoplastic elastomer is a polyester resin available in different hardness degrees. It is suitable for hydraulic applications, and ideal for support and backup rings. The material features the flexibility of elastomers and the mechanical properties of plastics. Excellent abrasion and cutting resistance. It has very good chemical properties, that make it compatible with lubricant oils and hydrocarbons, as well as with many fluids like acids and alkalis.

POM – Polymethyloxide

The polymethyloxide, commonly known as "acetal resin", is used to manufacture bushings, backup rings and guide shoes in cylinders. It features excellent properties in terms of stiffness, high shock resistance and fatigue strength, with high modulus of elasticity. It is not hygroscopic, therefore offers outstanding dimensional stability and can take heavy radial loads, with or without additional fillers. Depending on the additive type and content percentage, many different versions are available. One example is glass-fibre-filled POM, used to manufacture guide strips intended for contact with steel surfaces, or PTFE-filled POM to reduce friction,

Classificazione e denominazione dei materiali Artic Seals *Classification and designation of Artic Seals materials*

Utilizzato al naturale per accoppiamenti con metalli teneri come alluminio o ottone.

PA – Poliammide

Il poliammide, comunemente chiamato nylon, è un tecnopolimero. Presenta peso specifico relativamente basso, resistenza a urti e usura, discreto isolamento elettrico, resistenza a solventi, oli, grassi, carburanti e autoestinguenti. A differenza della resina acetica, il poliammide rimane più stabile alle temperature oltre i 140 °C. Utilizzato per pattini guida e boccole, dove la temperatura è costantemente elevata, è comunemente caricato con carbonio, PTFE, bisolfuro di molibdeno o con fibre di vetro e/o altri additivi per ottenere caratteristiche fisiche/ meccaniche più performanti.

PTFE – Politetrafluoroetilene

Il politetrafluoroetilene (PTFE) è il polimero del tetrafluoroetene. Ad alto peso molecolare, è un termoindurente senza punto di fusione e può essere lavorato tramite processo di sinterizzazione. Il PTFE presenta una serie di caratteristiche interessanti come:

- la completa inerzia chimica (non è aggredito dalla quasi totalità dei composti chimici)
- bassissimo coefficiente di attrito: a oggi il più basso tra i prodotti industriali
- la completa insolubilità in acqua e in qualsiasi solvente organico
- ottime qualità dielettriche
- ottima resistenza al fuoco: non propaga la fiamma.

Queste caratteristiche rimangono praticamente inalterate in un range di temperature comprese tra i -80 °C e i 260 °C con picchi anche superiori. Da qui l'ampio utilizzo in campo industriale, alimentare, elettrico e chimico. Nel settore idraulico-pneumatico è ampiamente utilizzato per la produzione di guarnizioni e fasce di guida. Avendo un basso modulo elastico è spesso proposto in tandem con particolari elastomerici ad alta memoria elastica o in metallo a forma di molla, per conferire elasticità/

to name a couple.

To manufacture parts in combination with soft metals, as aluminium or brass, the natural polymer should be the preferred choice.

PA – Polyamide

The polyamide commonly known as Nylon is a technopolymer. It features relatively low specific weight, shock and wear resistance, fairly good electric insulation, resistance to solvents, oils, greases and self-extinguishing fuels. Unlike acetal resin, this material is more stable at temperature over 140 °C. It is used for guide shoes and bushings, where temperature are constantly high. It is usually filled with carbon, PTFE, molybdenum disulfide, or glass fibre and/or other additives, to achieve improved physical/mechanical performing characteristics.

PTFE - Polytetrafluoroethylene

The polytetrafluoroethylene (PTFE) is the high-molecular-weight polymer of tetrafluoroethene. It is a thermosetting material with no melting point, that can be processed through sintering. The PTFE offers a number of interesting features, among which:

- *total chemical inertia, which makes it resistant to almost all chemicals;*
- *extremely low friction coefficient, currently the lowest among industrial products;*
- *complete insolubility in water and in any organic solvent*
- *excellent dielectric properties;*
- *outstanding fire resistance properties, i.e. no flame propagation.*

Those feature become even more important, as that they are maintained virtually unaltered in the temperature range between -80 °C and 260 °C, with even higher peaks.

It is used for a variety of applications in the industrial, food, electric and chemical fields. In the hydraulic-pneumatic segment it is used to produce seals and guide strips. Thanks to its low modulus of elasticity, it is often proposed in combination with high memory elastomeric parts or metal spring-

energia. In fase di montaggio è spesso necessaria la calandatura meccanica.

Proposto sia puro sia caricato con vari additivi e in varie percentuali con molibdeno, fibre di vetro, carbonio, grafite e bronzo, il PTFE è ricavabile sia con metodo isostatico, consigliato per alte pressioni, sia con metodo non isostatico fino a 400 bar.

Resina Fenolica

La resina fenolica è un materiale sintetico ottenuto dalla reazione chimica tra il fenolo e la formaldeide con cui si impregnano fibre di cotone o poliestere. Proposta sia al naturale sia additivata con PTFE, vetro e grafite, presenta elevata tenacità e resistenza a trazione e usura e un basso coefficiente di attrito. Buona la resistenza a oli minerali, grassi e a soluzioni non aggressive di acidi e alcali. È impiegata quasi esclusivamente per produrre anelli di guida ed è inadatta a impieghi alimentari per la sua composizione chimica.

NBR – Gomma Nitrilica

Elastomero a base di butadiene e di acrilonitrile in quantità variabile impiegato nella maggior parte delle applicazioni. Con ottimo ritorno elastico è impiegato principalmente nella produzione di guarnizioni e o-ring.

Particolarmente indicato a contatto con:

- oli a base paraffinica (alifatici)
- oli e grassi minerali (oli motore, per cambi, differenziali)
- oli idraulici
- acqua e soluzioni acquose (liscive).

Invecchia rapidamente se esposto a sole, aria o agenti atmosferici in generale. Estremamente versatile dal punto di vista applicativo grazie a compatibilità termica e stabilità delle caratteristiche meccaniche da -40°C a 120°C nelle sue varie formulazioni.

shaped ones, to add elasticity/energising properties. Mechanical keying is often required to accomplish the mounting procedure.

- *PTFE is available pure or filled with different additives in different percentages, as well as with molybdenum and glass, carbon, graphite and bronze fibres*
- *available proceeds with either isostatic method, which is recommended for high pressures, with that method does not isostatic up to 200 bar.*

Phenolic Resin

Phenolic resin is a synthetic material obtained by chemical reaction between the phenol and formaldehyde, used to impregnate cotton or polyester fibres.

It feature high toughness, low friction coefficient, high tensile strength and wear resistance .

It is used almost exclusively to manufacture guide rings.

PTFE and GRAPHITE are normally used as additives, both with cotton and polyester fibres.

Good resistance to mineral oils, greases and mild solutions of acids and alkalis.

Due to its chemical composition, it is not suitable for usage in the food industry.

NBR - Nitrile Rubber

This elastomer, based on butadiene and acrylonitrile in variable quantity, is used in the majority of applications.

It offers an excellent spring-back and is mostly used to manufacture O-rings.

It is ideal with:

- *paraffin-based oils (aliphatic)*
- *mineral oils and greases (engine oils, gearbox, differential oils, etc.)*
- *hydraulic oils*
- *water and water solutions (lyes).*

Exposure to air, sunlight or weathering in general accelerates the material aging.

Thanks to its thermal compatibility from -30°C to peaks of 120°C , it is extremely versatile in terms of applications, while maintaining its mechanical characteristics.

HNBR – Gomma Nitrilica Idrogenata

Elastomero ottenuto idrogenando un tipo di gomma nitrilica (NBR) che consente, specialmente se vulcanizzato a perossido, di ottenere una resistenza a temperature e abrasioni superiore a quella della gomma NBR standard. In particolare risulta indicato per:

- resistenza al calore
- resistenza all'ozono
- resistenza all'abrasione
- resistenza alle basse temperature.

La resistenza a oli e solventi risulta in media di poco superiore alla gomma nitrilica, salvo casi particolari. Ampio il campo di applicazione grazie al mantenimento di caratteristiche meccaniche dai -40°C a punte di 150 °C.

EPDM – Gomma etilene-propilene

È una gomma sintetica a base di etilene propilene più un terzo monomero (diene) che consente la reticolazione a zolfo. Grazie alla struttura chimica presenta una peculiare resistenza a fluidi come acqua, vapore e ambienti con alta percentuale di ozono. Per questo risulta particolarmente indicata per:

- acqua fino all'ebollizione
- vapore
- sistemi idraulici come impianti frenanti
- ozono
- agenti atmosferici
- basi
- solventi polari a temperatura ambiente
- range di temperature da -50°C a + 150°C.

FKM – Elastomero Fluorurato

Il fluoro elastomero, comunemente chiamato Viton®, è una gomma sintetica molto resistente al calore. Resiste ottimamente a oli, idrocarburi alifatici e aromatici e agli agenti chimici. Perfetto per la produzione di o-ring o di tenute dove è richiesta stabilità e memoria elastica alle alte temperature.

HNBR - Hydrogenated Nitrile Rubber

The chemical structure of this elastomer (resulting from the hydrogenation of a suitable type of NBR nitrile rubber) enables to increase the temperature and abrasion resistance compared to the standard NBR rubber, in particular if peroxide-vulcanized.

It is very suitable when the following requirements are requested:

- *heat resistance*
- *ozone resistance*
- *abrasion resistance.*

The resistance to oils and solvents is averagely slightly higher compared to nitrile rubber, with few exceptions.

It offers a very wide application range, while maintaining its mechanical features in the temperature range from -40°C to peaks of 150 °C.

EPDM- Rubber ethylene- Polypropylene

It deals with a synthetic rubber, based on ethylene-propylene and a third monomer (diene), which enables the sulphur crosslinking.

Thanks to its chemical structure, it features a excellent resistance to fluids such as water and steam, and is suitable for environments with high ozone percentage. For these reasons it is ideal for:

- *water up to boiling point*
- *steam*
- *special hydraulic systems such as braking systems*
- *ozone*
- *weathering*
- *alkalis*
- *polar solvents at room temperature*
- *temperature range between -50°C and + 150°C.*

FKM - Fluorocarbon Elastomer

The fluoro-elastomer, commonly known as Viton®, is a synthetic rubber with high thermal resistance.

It features excellent resistance to oils, aliphatic and aromatic hydrocarbons and chemicals.

Ideal to manufacture O-rings or seals for application requiring stability and memory at high temperature.

VMQ – Gomma Siliconica

Per la sua composizione chimica presenta una notevole resistenza ad agenti atmosferici, luce e ozono. Mostra inoltre un'eccellente resistenza a basse e alte temperature. La resistenza a lacerazione e abrasione non è completamente soddisfacente ma è ampiamente compensata dal suo basso coefficiente di attrito. Utilizzata in campo medicale, alimentare ed elettrico, è indicata per la resistenza a:

- agenti atmosferici
- a oli minerali, vegetali, naturali e idraulici (se la temperatura non supera i 60°C)
- a fluidi a base glicolica (non utilizzabile con le benzine)
- a temperature variabili tra – 55°C fino a punte di 180°C.

FMQ – Fluoro Silicone

Il fluorosilicone ha caratteristiche meccaniche simili alla gomma siliconica, ma la presenza del fluoro nella composizione ne aumenta di molto la compatibilità a idrocarburi alifatici e aromatici, agli acidi e agli oli animali e minerali per l'intero range di temperatura di lavoro. Al contrario della gomma siliconica, il fluoro diminuisce le prestazioni alle alte e basse temperature.

QMV - Silicone Rubber

Thanks to its chemical composition, it features high resistance to weathering, light and ozone. Moreover, the excellent properties of resistance to high and low temperatures enable a wide operating range. Although its tearing and abrasion resistance is not completely satisfactory, its low friction coefficient compensate for efficiency. It is used both in the medical and food industry. Ideal for applications with requirements for:

- *resistance to weathering*
- *resistance to mineral, vegetable and natural oils, and also hydraulic oils, if temperature does not exceed 60°C*
- *resistance to glycol-based fluids*
- *never use with petrols*
- *resistant to variable temperatures from – 55°C to peaks of 180°C.*

FMQ - Fluorine Silicone

The fluoro silicone features mechanical characteristics similar to the fluoro rubber, but the fluorine in the composition increases considerably the compatibility with animal oils in the entire operating temperature range, as well as with aliphatic and aromatic hydrocarbons and acids. Conversely, it decreases performances at high and low temperatures.

Note about the pigmentation of the polymers used by Artic Seals:
Possible variations in colour shades may result from the usage of master-batch free from heavy metals. Such slight variations do not affect the seals mechanical features

Proprietà fisiche e meccaniche degli elastomeri *Elastomers physical and mechanical properties*

Nella determinazione e configurazione di una tenuta, nonché nel garantire le sue performance nel tempo, bisogna analizzare attentamente le caratteristiche fisiche e meccaniche dei materiali.

Durezza

La durezza è la proprietà del materiale che misura la resistenza alla penetrazione. Nel campo degli elastomeri esistono due scale di misurazione: la durezza Shore (Shore A per durezza comprese tra 40 a 90 Sh e Shore D per valori da 90 Sh) e il Grado Internazionale di Durezza della Gomma (IRHD). Per la misurazione si usa un durometro con puntina a tronco-cono per la Shore A e con angolo a 30° per la Shore D.

In entrambi i casi la misurazione è regolamentata dalle norme DIN 53505 e ASTM D2240. Di seguito lo schema di sovrapposibilità delle due scale e il posizionamento dei principali polimeri.

To specify and design a seal, as well as to guarantee its performances over time, it is necessary to analyse the material essential physical/mechanical features.

Hardness

Typically, under hardness we understand the property, that specifies the material resistance to penetration.

The two main hardness measuring scales in the field of elastomers are the Shore hardness and the International Rubber Hardness Degrees (IRHD).

As for Shore hardness, two more reference scales are used, i.e. "Shore A" and "Shore D".

To measure the hardness degree, both scales use an hardness meter, but different indenters: the indenter for scale "Shore A" features a truncated cone point, while the one for scale "Shore D" has a 30°-angled point.

Durometer hardness test

Fig.2: test di durezza
Pic.2: hardness test

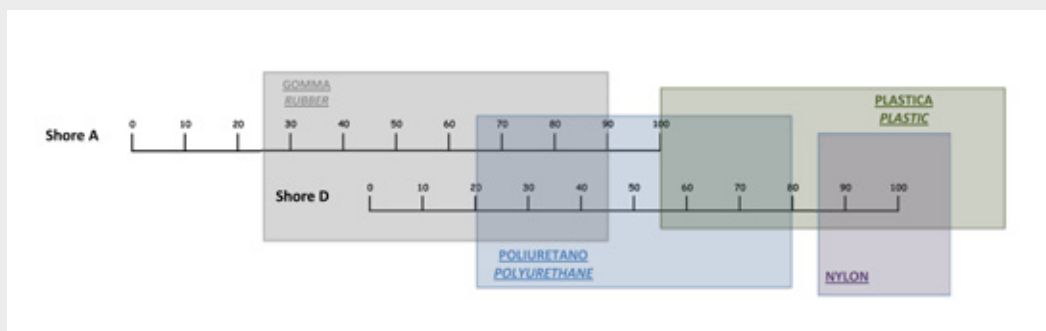

Fig.3: scala di durezza
Pic.3: hardness scale

La durezza è un parametro molto importante in ambito guarnizioni perché influenza sia l'attrito dinamico sia di primo distacco. A parità di spinta e rugosità della sede, una durezza bassa riduce l'attrito di primo distacco; al contrario, una durezza elevata riduce l'attrito dinamico. La durezza a sua volta è influenzata dalla temperatura e diminuisce con l'innalzarsi della temperatura. Generalmente gli elastomeri con durezza bassa, cioè più teneri, si adattano meglio alle superfici più ruvide ma sono più soggetti all'estrusione. La durezza è generalmente influenzata anche dai liquidi con cui la guarnizione rimane in contatto.

Scale Shore A is used for hardness values between 40 and 90 Sh, while for higher values the Shore D scale is the reference one.

In both cases, the measurements conform to standards DIN 53505 and ASTM D2240. Find below the reference scales overlapping pattern, as well as the position of the main polymers.

In the field of seals, hardness is a very important parameter, that needs to be taken into account, as it affects both dynamic friction and stiction.

Thrust and seat roughness being equal, a low hardness degree reduces stiction, while a high hardness degree reduces dynamic friction.

Hardness, in turn, is influenced by temperature, i.e. the higher the temperature and the lower the hardness. In general, elastomers with low hardness degree, i.e. softer, are better suited for rougher surfaces, but are more prone to extrusion.

Resistenza alla compressione, memoria elastica, compression set

La resistenza alla compressione è la capacità di un elastomero di ritornare al suo spessore originale dopo prolungate sollecitazioni di compressione e deformazione a una data temperatura. Un elastomero, compresso a lungo nel tempo, tende infatti a perdere la sua capacità di ritornare alla dimensione originale.

La differenza tra la dimensione originale e quella finale si esprime in percentuale e rappresenta il compression set del materiale analizzato. Più la percentuale di compression set è bassa, migliore è la resistenza alla compressione di un materiale.

Compressive strength, memory, compression set

It deals with the capacity of elastomers to recover their original thickness after experiencing prolonged compressive and deformation stresses at a given temperature. After a long time under compression, elastomers tend to lose the ability to recover their original thickness. The difference between the original and final dimensions is expressed in percentage and represents the compression set of the material being tested. The lower the compression set percentage and the better the material compressive strength.

As far as seals are concerned, their efficiency is strongly influenced by the seal material compression

Fig.4: test compression set

Pic.4: compression set test

In ambito guarnizioni, la funzionalità di una tenuta è fortemente influenzata dal livello di compression set del materiale di realizzazione. Una scarsa resistenza alla compressione, ossia un alto compression set, può compromettere la funzionalità della guarnizione che non è più in grado di mantenere la tenuta per un lungo periodo di tempo.

Per contro, un'alta resistenza alla compressione, ossia un basso compression set, è indicativa di una buona durata nel tempo della tenuta statica e dinamica. Visto che la tenuta è sottoposta a pressione durante il ciclo, è fondamentale che la guarnizione riprenda la sua forma originale a fine ciclo per evitare la perdita di fluido.

Modulo di elasticità

Il modulo elastico misura la quantità di forza necessaria a mettere in tensione un provino di materiale e allungarlo fino a una percentuale predefinita della sua dimensione originaria.

Normalmente si valuta il modulo elastico al 50% (forza necessaria per allungare il provino del 50% della sua dimensione originaria), al 100% e al 300%. Più è alto il valore confermato dalla prova di trazione, migliori sono le caratteristiche del materiale. Nel campo delle tenute è preferibile un elevato modulo elastico in quanto garantisce:

Fig.5: test allungamento

Pic.5: elongation test

set. A low compressive strength, i.e. a high compression set value, can negatively influence the efficiency of the seal, that will no longer be able to guarantee the sealing function over a long period of time. Conversely, a high compressive strength, i.e. a low compression set value, suggests good dynamic and static sealing efficiency over time. As seals are subject to pressure during the working cycle, the ability to recover their original shape at the end of the cycle is of paramount importance, in order to prevent fluid leakages.

Elastic modulus

The modulus of elasticity measures the force necessary to tension a material specimen and extend it to a given percentage of its original size.

Normally the test evaluates the modulus of elasticity at 50% (force necessary to extend the specimen by 50% of its original size), at 100% and at 300%. The higher the value measured during the tensile test, and the better the material characteristics. In the fields of seal, a high modulus of elasticity is preferable, as it ensures:

Proprietà fisiche e meccaniche degli elastomeri
Elastomers physical and mechanical proprieties

- elevata forza del labbro contro le superfici a contatto, in caso di tenuta statica e dinamica
- maggiore resistenza all'estrusione.

La tensione (o allungamento), come mostra il grafico, è la deformazione elastica che il materiale può subire senza che si verifichi irreversibilità o rottura ed è un parametro inversamente proporzionale alla durezza del materiale.

Per quanto riguarda il carico di rottura (tenacità), è misurata la quantità di forza che il provino può assorbire per superare la fase elastica, lacerarsi fino alla rottura e assumere una forma irreversibile.

Il modulo elastico (misurato in unità di sforzo divise per unità di allungamento: N/cm^2) è dunque un indicatore fondamentale sia per la tenacità della tenuta sia per la repulsione all'estrusione.

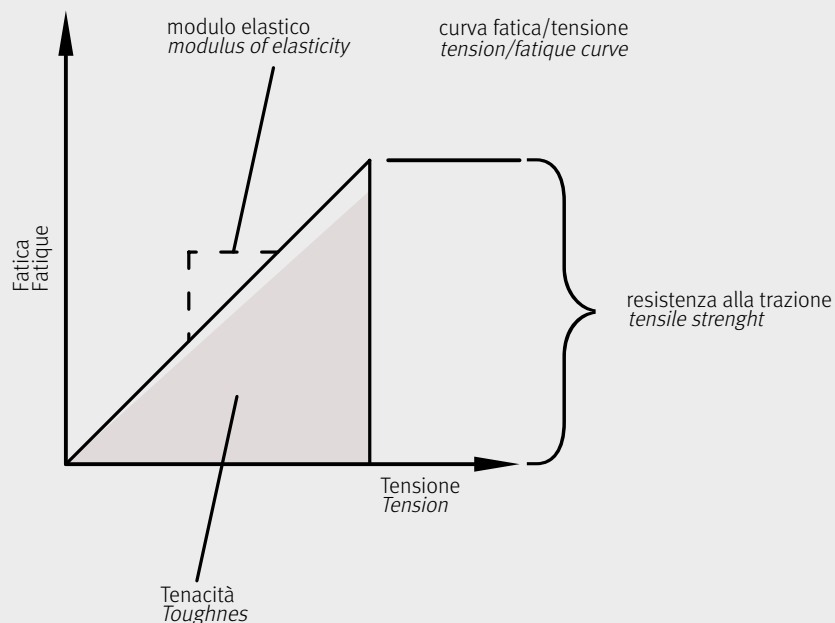

- *high lip force against the mating surfaces, both in dynamic and static sealing*
- *higher resistance to extrusion.*

Moreover, as shown in the diagram on the side, under tension (elongation) we understand the elastic deformation that the test material can undergo without suffering breaking or irreversible effects. Elongation is a parameter inversely proportional to the material hardness.

This modulus is a key indicator both for the seal toughness and its resistance to extrusion.

The modulus is measured calculating the stress and dividing it by the elongation, therefore is measured in stress units divided by elongation units: N/cm^2 . Concerning the ultimate tensile stress (toughness), it is measured the force required by a specimen to exceed the elastic phase and tear to break, thus taking an irreversible shape.

Fig.6: curva fatica
 Pic.6: tension curve

Resistenza all'abrasione

Altra caratteristica fondamentale nella determinazione della tenuta è la resistenza all'abrasione.

A differenza della resistenza al taglio, che avviene in un preciso momento, la resistenza all'abrasione è un fenomeno che si manifesta nel tempo, dovuto a uno sfregamento fra superfici a contatto.

La prova per valutare la resistenza avviene con un rullo di carta vetrata sul quale si sfrega il provino per un tempo prefissato. Si misura il peso prima e dopo il test e si esprime, in percentuale rispetto al peso iniziale, la differenza tra i due dati. Più il valore è basso, migliore è la resistenza dell'elastomero all'abrasione.

Lacerazione e usura

La resistenza alla lacerazione di un elastomero è un parametro molto importante per le applicazioni in cui il manufatto è soggetto a trazione o a rischio di tagli superficiali capaci di innescare lacerazioni al manufatto stesso.

Abrasion resistance

Another essential characteristic to specify a seal is the abrasion resistance.

Unlike shearing stress, which occurs at a given time, abrasion occurs over time, due to the rubbing between mating surfaces.

To evaluate the abrasion resistance, a test is carried out, where a specimen rubs over a sandpaper roll for a given period of time. The weight is measured before and after the test and the difference between the measurements is expressed in percentage compared to the initial weight. The lower the value, and the better the abrasion resistance of the elastomer.

Tear and wear

The tearing resistance of an elastomer is very important for all applications in which an item is subject to traction, particularly for those where there is a risk of significant surface cuts, that could easily induce tears, resulting in the item complete deterioration.

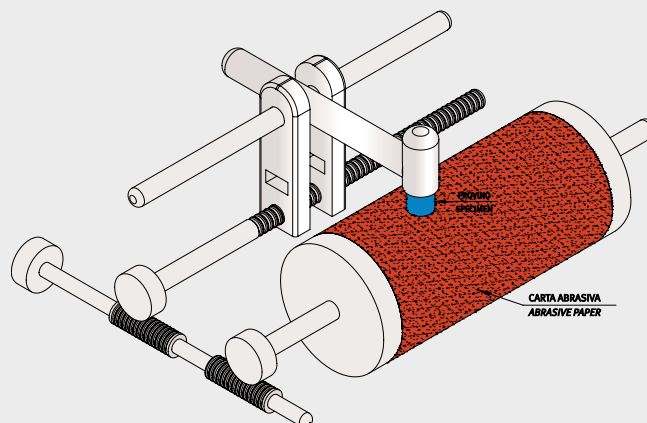

Fig.7: macchina per test di abrasione
 Pic.7: abrasion test machine

Altrettanto importante è la determinazione della resistenza all'usura necessaria per una corretta valutazione di progetto in tutte le applicazioni di tenute dinamiche.

I fattori in gioco per la determinazione della resistenza di un elastomero sono essenzialmente: il tipo di polimero, la durezza, la finitura superficiale, la lubrificazione, le velocità relative e l'ambiente di funzionamento.

Una buona resistenza è fondamentale anche durante le fasi di lavorazione (durante lo stampaggio agevola il distacco dallo stampo) e di montaggio dove previene lacerazioni.

Resilienza o rimbalzo

La resilienza o rimbalzo rappresenta la capacità di un elastomero di recuperare forma e grandezza originali dopo una deformazione temporanea. La prova di resilienza prevede il lancio di un pendolo contro un provino fissato alle due estremità con staffe. L'altezza a cui il pendolo rimbalza è poi calcolata come percentuale rispetto all'altezza di caduta iniziale.

Determining the wear resistance is essential for a correct project evaluation in dynamic sealing applications.

The factors involved are: polymer type; hardness; surface finishing; lubrication; relative speeds; operating environment.

It deals with the resistance a material opposes to cut initiating, when a tension stress is applied, and is measured in kN/m (kN per meter).

It is a very significant parameter that shall be taken into account also during the item processing phases and the installation in its seat. A good resistance in fact, facilitates the removal from mould during moulding, and prevents tears during mounting.

Resilience or rebound

The resilience, or rebound, represents the ability of an elastomer to recover its original size and shape after a temporary deformation stress. The resilience test is carried out by dropping a plunger on a specimen. The plunger rebound height is then calculated as percentage of the initial dropping height.

Fig.8: schema curva test resilienza o rimbalzo
 Pic.8: resilience or rebound's test curve

Attrito e lavorazione delle sedi

Friction and grooves machining

Attrito e assorbimento di potenza

L'attrito dovuto allo strisciamento sulla superficie dell'albero o sulla parete interna del cilindro contro lo spigolo di tenuta dà luogo a dissipazione di energia. E per contenerla nei giusti limiti occorre impostare correttamente:

- la geometria e il materiale del labbro di tenuta
- il grado di rugosità delle superfici e la loro finitura
- la pressione d'esercizio
- la velocità
- la viscosità del lubrificante.

È molto importante ridurre l'attrito al minimo perché generalmente causa calore, usura, perdite e riduce l'efficienza del sistema di tenute.

Per la funzionalità dell'anello di tenuta è fondamentale anche il carico radiale. Un eccessivo carico provoca infatti un forte attrito con alti assorbimenti di potenza e rapide usure. La durata e l'efficacia di una guarnizione dipendono dalla qualità della superficie dell'area di contatto dove graffi, fori, porosità e segni di utensili non sono ammessi, soprattutto dove scorre dinamicamente la guarnizione. I parametri utilizzati per definire la finitura sono Ra, Rt, RMAX e sono conformi alla ISO 4287/1. La tabella 12 evidenzia l'inopportunità di considerare i soli valori di Ra e Rt per valutare la guarnizione da adottare.

I picchi superficiali mostrano che a parità di valori Ra e Rt il profilo con minori asperità (v. RMR) presenta, con la guarnizione, una maggiore superficie di contatto con evidente beneficio della durata. Una scelta accurata delle rugosità dei componenti del cilindro consente di salvaguardare la longevità della tenuta. Superfici con un elevato grado di rugosità comportano un maggiore attrito con conseguente deterioramento e usura delle tenute.

Friction and power consumption

Sliding friction on the shaft surface or on the cylinder inside wall, against the sealing lip, results in energy dissipation. To keep energy dissipation within correct limits, the following parameters shall be properly set:

- *sealing lip geometry and material*
- *surfaces roughness degree and therefore finishing*
- *operating pressure*
- *speed*
- *lubricant viscosity.*

Minimizing the friction is of paramount importance, as it generally causes:

- *heat*
- *wear*
- *leakage.*

Basically a reduced efficiency of the sealing system. The radial load is an essential factor for the sealing ring efficiency. An excessive radial load causes high friction levels, resulting in high power consumption and rapid wear. The seal life and efficiency depend on the surface quality of the contact area. Scratches, holes, porosity, tooling marks are not admissible. It is very important to pay close attention to the surface quality, in particular in the area where the seal slides dynamically. The parameters used to specify the finishing are Ra, Rt, RMAX and conform to the standard ISO 4287/1. Table 12 highlights clearly that, considering only the values for Ra and Rt is not enough to identify the most suitable seal. If the surfaces involved feature a high roughness degree, friction will increase, resulting in the seal deterioration and wear.

The surface peaks show that, Ra and Rz values being equal, the profile featuring less unevenness (see RMR) offers a larger contact area with the seal, which is obviously beneficial for the seal duration. A careful choice of the cylinder components roughness supports the seal durability.

$R_{t\text{ DIN}}$	0,63 - 2,50	< 6,3
R_a	0,10 - 0,60	< 1,6

Indicazione di rugosità nelle lavorazioni

Per ottenere un accoppiamento fra le varie parti in movimento e preservare le tenute durante il loro ciclo di lavorazione, Artic Seals consiglia di attestarsi sui seguenti gradi di rugosità:

stelo 0,1 - 0,4 $\mu\text{m Ra}$
ottenibile da finitura come rettificazione, cromatura, pelatura

camicia interna 0,2 - 0,6 $\mu\text{m Ra}$
ottenibile da finitura come levigatura, alesatura, rullatura.

Occorre considerare che, a parità di grado di rugosità, i profili superficiali ottenibili dalle varie tipologie di lavorazione saranno significativamente differenti tra loro, come mostrano gli schemi sotto riportati. Per questa ragione suggeriamo di attenersi a un profilo superficiale, come mostrato in fig. 12.

Quando il grado di rugosità ha un valore relativamente basso, ma le creste si presentano come evidenziato in fig.11 (lucido di trafilatura con R_{MR} 15%), si consiglia di adottare tenute in PTFE caricato a bronzo ed evitare gomme e/o poliuretani.

Fig.11-Pic.11: $R_a = 0,4 \mu\text{m}/16 \mu\text{inc}$ $R_{MR} = 15\%$

Fig.12-Pic.12: $R_a = 0,4 \mu\text{m}/16 \mu\text{inc}$ $R_{MR} = 75\%$

Surface roughness

To obtain the right fitting among the different moving parts, while protecting the seal during its operating cycle, Artic recommends the following roughness degrees:

Rod = 0,1 ÷ 0,4 $\mu\text{m Ra}$
achieved through finishing typologies like: grinding, chrome, peeling

Inside liner = 0,2 ÷ 0,6 $\mu\text{m Ra}$
achieved through finishing typologies like: honing, boring, rolling.

It should also be considered that, roughness degree being equal, the surface profiles can significantly vary, depending on the machining.

For this reason, it is advisable to choose a surface roughness that enables a profile similar to the one shown in Pic.12.

If the roughness degree is relatively low, but peaks appear as shown in Pic.11 (Bright drawn with R_{MR} 15%) it is recommended Bronze-filled PTFE seals and advises against rubber and/or Polyurethanes.

Fig.13: esempi di appoggio/contatto di diversi materiali a parità di valore di rugosità della superficie lavorata

Pic.13: example of contact profile of different material on machined surface having same roughness value

Dimensionamento delle sedi, gioco di accoppiamento

L'ampiezza massima consentita del gioco di accoppiamento tra testata/stelo e pistone/camicia deve essere attentamente valutata affinché non intervengano problemi di estrusione nella parte posteriore della guarnizione (v. fig. 14). Tale gioco dipende principalmente dalla durezza del materiale con cui è costruita la tenuta, dalla pressione massima presente nel cilindro, dalla temperatura e dalla resistenza al carico radiale degli anelli di guida. La tabella 4 mostra il gioco di accoppiamento che si deve mantenere tra stelo/testata e tra pistone/camicia.

Il test è stato eseguito con olio a temperatura a 60° C con materiale 93 Shore A. La figura 15 mostra i valori indicativi del gioco massimo ammesso in funzione della pressione di esercizio utilizzando guarnizioni di materiale e durezza differenti.

Groove dimensioning, Fitting clearance

The maximum admissible fitting clearance value between head/rod and piston/liner shall be carefully evaluated, in order to prevent extrusion problems in the seal rear area, (see Pic. 14). The clearance depends mainly on the seal material hardness, the maximum pressure in the cylinder, the temperature and the radial load resistance of the guide rings. Table 4 lists the fitting clearance values that shall be maintained between rod/head and piston/liner. The test has been carried out with oil at 60° C, using a material featuring a hardness value equal to 93 Shore A.

Picture 15 shows the reference values for the maximum admissible clearance as a function of the operating pressure, using seals in different materials and featuring different hardness degrees.

Analisi Elementi Finiti

Finite Elements Analysis

Metodo FEA

Il metodo degli elementi finiti si basa sul concetto di descrivere lo stato di deformazione di un sistema continuo mediante funzioni di spostamento, definite in piccole regioni del “continuum”. In quest’ottica le soluzioni sono formulate per ciascuna unità e combinate per ottenere la soluzione del corpo o della struttura originale.

L’analisi degli elementi finiti (FEA) consente di calcolare il comportamento strutturale di un sistema applicando il concetto della discretizzazione, ossia la suddivisione della struttura iniziale in un sistema equivalente di strutture più piccole o unità, tali che il loro assemblaggio dia luogo alla struttura reale. Si ha quindi la definizione di una griglia geometrica (mesh) tramite la quale il modello geometrico è diviso in tanti piccoli elementi di facile calcolo. Il metodo degli E.F. è un metodo approssimato e la convergenza dell’approssimazione con la soluzione esatta deriva da numerosi parametri, ma se l’impostazione è corretta l’approssimazione è molto vicina alla soluzione esatta.

Tramite l’analisi degli elementi finiti, completamente integrata nel software CAD, Artic Seals ottimizza e convalida in modo rapido ed efficiente tutte le fasi di progettazione verificando qualità, prestazioni e sicurezza del prodotto. La FEA diviene così una parte del processo di progettazione che riduce la necessità di costosi prototipi ed elimina rilavorazioni e ritardi. L’applicativo in uso utilizza la formulazione dello spostamento del metodo degli elementi finiti per calcolare gli spostamenti, le deformazioni e le

FEA method

The finite elements method is based on the concept of describing the state of deformation of a continuous system by means of displacement functions, defined in small areas of the “continuum”. In this perspective, solutions are formulated for each unit and combined to obtain the body or original structure solution.

Finite element Analysis (FEA) enables to calculate the structural behaviour of a system applying the core concept of discretization, i.e. dividing the initial structure in an equivalent system of smaller structures or units, such as their assembling results in the real structure. We get then a geometrical mesh, through which the geometrical model is divided into many small, easy-to-calculate items. This equates to describe a structure using a finite numbers of points (called nodes).

The finite elements analysis is not an exact method, but approximate. The convergence of the approximation with the exact solution derives from a variety of parameters. If the model is set in correct form, the approximations achieved are anyway very close to the exact solution.

Applying the FEA fully integrated in our CAD software, we can optimize and validate each design phase quickly and easily, to check the product quality, performance and safety. The FEA can therefore be considered as a normal part of the designing process, reducing the need of costly prototypes, eliminating reworking and delays.

sollecitazioni dei componenti sottoposti a carichi interni ed esterni. La geometria sottoposta ad analisi è suddivisa utilizzando elementi tetraedrici (3D), triangolari (2D) ed elementi trave, quindi è risolta attraverso un solutore Direct Sparse o iterativo.

L'analisi consente inoltre di:

- ridurre prototipi e collaudi fisici
- prevedere e migliorare prestazioni e affidabilità di prodotto
- valutare diversi progetti e materiali
- ottimizzare i progetti e ridurre il consumo di materiali.

The application in use at Artic Seals, using the formulation of the displacement of the finite element method to calculate displacements, strains and stresses of the components subjected to internal and external loads. The geometry is divided subjected to analysis using tetrahedral elements (3D) triangular elements (2D) and beam elements, then it is resolved through a Direct Sparse solver or iterative.

In addition, we can:

- *reduce the need for physical prototypes and testing*
- *predict and improve the performance and reliability of a product*
- *evaluate different designs and materials*
- *optimize designs and reduce the consumption of materials.*

Condizioni di immagazzinamento

Storage conditions

Le condizioni di immagazzinamento sono fondamentali per prodotti realizzati in elastomeri e termoplastici, molto sensibili alle condizioni ambientali. Un immagazzinamento inadeguato può causare significative variazioni nelle proprietà fisiche e meccaniche e provocare indurimenti, rammollimenti, crepe, screpolature o altre degradazioni dovute a ossigeno, ozono, luce, calore e/o umidità che possono compromettere l'utilizzo di questi polimeri.

Per stoccare correttamente gli elastomeri termoplastici ed evitare il loro danneggiamento andrebbero rispettate le seguenti raccomandazioni:

Temperatura

La temperatura di immagazzinamento non dovrebbe superare i 50°C. Temperature inferiori non costituiscono invece un problema.

Luce

Proteggere dalla luce diretta del sole o da altre fonti di luce artificiale se molto potenti. In caso utilizzare confezioni con filtri UV.

Umidità

L'umidità ideale è di circa 65% in ambiente privo di correnti dirette.

Ossigeno e ozono

I prodotti in materiali elastomeri devono essere protetti dalle correnti d'aria. Dato che l'ozono è particolarmente dannoso per la gomma, i locali di stoccaggio devono essere privi di attrezzature che possano generare scintille o scariche elettriche. Si suggerisce il confezionamento in opportuni contenitori.

The storage conditions are a very important issue when it comes to products in elastomeric or thermoplastic materials, as they are environmentally sensitive. If not suitably stored these polymers experience significant changes in their physical or mechanical properties, that can even impair the item usage. Hardening, softening, cracks, or other types of damage may occur, due to the exposure to oxygen, ozone, light, heat and/or humidity.

Below are provided recommendations concerning the most suitable storage conditions for our products, that should be complied with to prevent the products damaging.

Temperature

The storage temperature should not exceed 50°C; Lower temperatures do not impair thermoplastic, elastomeric materials. We recommend to warm up the items to a temperature of 30° before mounting.

Light

Do not expose to direct sunlight or other artificial light sources, if very powerful. If this condition cannot be avoided, use packages supplied with UV filters;

Humidity

The ideal humidity level is about 65% in an environment with no direct currents;

Oxygen and ozone

Products in elastomeric material should be protected from drafts. Ozone is especially detrimental for rubber, in particular in the areas where the products are to be stored. For this reason no equipment that could produce sparks or electric discharges should be placed in those areas. We recommend packaging in suitable boxes.

Deformazione

I prodotti realizzati in termoplastici elastomeri dovrebbero sempre essere stoccati in spazi adeguati alle loro dimensioni evitando schiacciamenti, deformazioni, distorsioni e stiramenti. Si consiglia pertanto di posizionarli in appositi scaffali o piani e di non appenderli o schiacciarli.

Contatto con liquidi

Durante lo stoccaggio evitare il contatto con solventi, acidi, basi, oli e grassi.

Contatto con metalli

Alcuni metalli come il manganese in ferro, il rame o le sue leghe possono essere particolarmente nocivi per la gomma. Pertanto si suggerisce di separare questi materiali con carta, polietilene o normale busta di cellophane.

Rotazione di magazzino

Si consiglia di applicare una corretta rotazione delle scorte di magazzino onde evitare lunghi periodi di stoccaggio.

Pulizia

In caso si renda necessario, lavare con acqua e sapone e asciugare a temperatura ambiente prima dell'uso. Solventi organici come tricloroetilene, tetracloruro di carbonio e petrolio risultano molto aggressivi e se ne sconsiglia l'uso.

Durata stoccaggio

La tabella sottostante riporta la durata dei prodotti realizzati nei materiali più comuni e stoccati in modo corretto. Lo scorretto immagazzinamento riduce la durata.

Deformation

Products in thermoplastic elastomers should be stored in areas suitable for their dimensions, thus avoiding squeezing, distortion or stretching. We recommend to place them on suitable shelves or resting surfaces. We do not recommend hanging or pressing them. Avoid stretching and deformations.

Contact with fluids

During storage, avoid contact with solvents, oils or greases.

Contact with metals

Some metal as manganese, iron and copper or its alloys may be detrimental for rubber. Therefore, we recommend to keep this materials separated using paper, polyethylene or simple cellophane bags.

Inventory turnover

We recommend applying a correct stock rotation, to avoid long storage periods of the items.

Cleaning

If necessary, wash with water and soap and dry at room temperature before use. Organic solvents as trichloroethylene, carbon tetrachloride and petrol are aggressive and not recommended.

Storage period

The table below shows the life of products made out of the most common materials in ideal storage conditions.

Unsuitable storage conditions result in the reduction of the product life.

Una volta prelevati i prodotti da magazzino e prima di procedere con il loro utilizzo si consiglia di verificare la durata di stoccaggio e l'assenza dei principali difetti da immagazzinamento inadeguato come:

- difetti meccanici
- distorsioni permanenti
- crepe o screpolature superficiali
- incollaggio o indurimento/rammollimento superficiale.

I pezzi con sezione inferiore a 1 mm presentano maggiori criticità in termini di invecchiamento.

After collecting the products from the warehouse and before using them, we recommend to check the storage period and make sure no major damages have occurred, e.g.:

- *mechanical faults*
- *permanent distortions*
- *surface cracks*
- *gluing or surface hardening/softening.*

Thinnest items (section less than 1 mm) are more critical when it comes to ageing.

Quanto riportato è necessario a preservare la qualità del prodotto; tuttavia Artic Seals non si assume alcuna responsabilità per danni e alterazioni addebitabili a ulteriori cause non previste da tali raccomandazioni.

The recommendations above are to be complied with to preserve the product quality. Nevertheless Artic Seals shall not assume no responsibility whatsoever for damages or alterations due to other causes, that are not covered by these recommendations.

Qualità e certificazioni

Quality and certifications

Artic Seals realizza i propri prodotti tramite un Sistema di Qualità Totale Certificato. Obiettivi e piani per la qualità, sviluppati con il quality management del gruppo GAPI, si basano su fabbisogni e aspettative del mercato e sul soddisfacimento delle esigenze del cliente tramite continui miglioramenti di progetto, prodotto e servizio.

La qualità dei prodotti costituisce l'obiettivo principale perseguito nel corso degli anni. Introducendo attrezzature sempre più sofisticate e legate a innovazione e automazione (robot antropomorfi per lo stampaggio, trimming e packaging automatici, impianti di visione artificiale computerizzata e automatizzata per il controllo al 100% dei prodotti ove richiesto) si è voluto ottenere costanza, stabilità e ripetibilità di tutti i processi. Ogni fase risulta oggi integrata all'interno dell'ERP aziendale per garantire un immediato controllo sui processi e sulle relative performance.

In questa stessa ottica, e per garantire la totale conformità dei prodotti ai requisiti specificati, effettuiamo accurati controlli in fase di accettazione delle materie prime, durante il processo e in fase di collaudo finale.

Divenuta lead center per il settore idraulico e pneumatico, Artic Seals sfrutta le sinergie tra le aziende del gruppo GAPI per condividere tecnologie e competenze sviluppate in specifici settori; per creare prodotti tramite l'ausilio di materiali e processi interni al gruppo e accedere a laboratori di analisi dove testare le principali proprietà chimiche, fisiche e meccaniche dei materiali trattati.

Conformemente agli standard e alle certificazioni di gruppo, Artic Seals esegue un attento controllo in fase di accettazione delle materie prime, durante il processo e in fase di collaudo finale per garantire la totale conformità dei prodotti ai requisiti specificati. I certificati di collaudo e gli attestati di conformità sulla merce in consegna sono rilasciati dall'ufficio tecnico.

Artic Seals manufactures its products in compliance with a Certified Global Quality System, that provides quality targets and programmes developed together with the Gapi Group Quality management and based on the market needs and expectations, striving to meet the customers' requirements by constantly improving designs, products and services.

The product quality is the main target we invested in over the years, introducing increasingly sophisticated equipment pursuing innovation and automation, to achieve consistency, stability and repeatability for all our processes: anthropomorphic robots in moulding departments, completely automatic trimming, automatic packaging and computer vision, totally automatic systems to check the product 100%, where requested. Each phase is integrated into the company's ERP system to provide immediate monitoring of processes and related performances. Artic Seals carries out a careful inspection of incoming raw materials, as well as during the process and the final testing phase, to guarantee total conformance of the products with the specifications.

The synergies among the group's companies play a vital role in terms of access to technologies, skills and know-how especially developed for specific areas of competence and shared among the subsidiaries. In this context Artic Seals plays a crucial role as Hydraulic and Pneumatic Lead Center and develops its products using the group own materials and processes.

The group provides also a key service related to material science, offering the subsidiaries access to two analysis labs to test the main chemical, physical and mechanical properties of the materials processed.

To receive testing and/or compliance certificates for the supply goods, please turn to our offices and possibly specify the reference standard.

Montaggio Assembling

Avvertenze e precauzioni di montaggio nei sistemi Oleodinamici

Durante il montaggio, per un ottimo funzionamento delle guarnizioni occorre evitare tagli o deformazioni permanenti. Fondamentale anche il rispetto delle norme internazionali ISO per quanto riguarda le dimensioni degli alloggiamenti e le tolleranze.

Assembling instructions

For a correct sealing functioning it's necessary to avoid cuts or permanent deformations during the assembling process. It's also recommended to follow the ISO norms concerning housings and tolerances. Regarding the surfaces finish, take a look at the following sketches 18 and 19 indicating the values to be respected.

A further polishing operation is usually suggested before mounting, since the only grinding operation isn't recommended.

Montaggio tenuta stelo - PTFE

Le guarnizioni PTFE necessitano di precauzioni estremamente rigorose, maggiori che per tutte le altre tipologie di tenuta. È fondamentale eliminare gli spigoli vivi e le bave nelle sedi.

Il montaggio delle guarnizioni per stelo segue normalmente questa sequenza:

- installare o-ring nella sede (fig. 20)
- deformare l'anello in PTFE (fig. 21) senza creare piegature ad angolo vivo
- inserire l'anello nella sede cercando di ridargli la formazione iniziale (fig. 22)
- calibrare con utensile conico in materiale plastico.

Fig. 20 - Pic.20

Fig. 21 - Pic.21

Fig. 22 - Pic.22

Fig. 23 - Pic.23

Assembling rod seal - PTFE

PTFE seals require careful assembling operations in comparison to other types of seals. It is necessary to remove flashes and/or cutting edges in the grooves.

The rod seal is usually assembled in the following sequence:

- fit the O-Ring into the groove (Pic.20)
- twist the PTFE ring (as shown in Pic.21), without causing any open edge curl
- insert the ring into the groove restoring the original shape (Pic.22)
- calibrate with a plastic conical tool (Pic.23).

Montaggio tenuta pistone - PTFE

Analogamente a quanto indicato in precedenza, il montaggio delle guarnizioni per pistone segue normalmente questa sequenza:

- installare l'o-ring nella sede
- spingere dilatando l'anello in PTFE, con l'ausilio di un mandrino e una bussola a espansione (fig. 24)
- calibrare con una bussola opportunamente dimensionata (fig. 25).

Si consiglia di riscaldare la guarnizione fino a 50°C.

Assembling piston seal - PTFE

As previously indicated, the piston seal is usually assembled in the following sequence:

- fit the o-ring into the groove
- twist the PTFE ring using a mandrel and an expansion bush (Pic.24)
- calibrate with a bush with right dimension (Pic.25).

Warming the seal up to 50°C is recommended.

Fig. 24 - Pic.24

Fig. 25 - Pic.25

RSA

TENUTA STELO TIPO RSA

Descrizione

La guarnizione tipo RSA, progettata con labbro dinamico più corto rispetto a quello statico, ha impieghi dove i disallineamenti dello stelo sono elevati e dove le pressioni possono raggiungere valori elevati.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C
 Velocità: < 0.5 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: fluidi idraulici a base minerale minerale (tabella 3 p. 14)

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set ed elevata resistenza all'abrasione.

Ha un durezza di 93 Shore A ± 2.

Codice materiale: CO

Montaggio

Per evitare che la guarnizione si danneggi occorre eliminare le bave e gli spigoli taglienti presenti nella sede e sullo stelo.

È sempre consigliato lubrificare la tenuta prima del montaggio per agevolare l'inserimento dello stelo.

Per ulteriori informazioni leggere le istruzioni a p. 63.

RSA TYPE ROD SEAL

Description

The RSA seal has a dynamic lip shorter than the static one and it is used in cases of high rod misalignments and possible high pressure.

Technical data

Pressure: < 400 bar, at a temperature of 60° C
 Speed: < 0.5 m/s
 Temperature: from - 35° C to + 100° C, with peaks up to 110° C
 Fluids: mineral hydraulic fluids (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.

The hardness is 93 Shore A ± 2.

Compound reference: CO

Assembling

To prevent any damage to the seal, remove any flash and cutting edges in the housing and on the rod.

The seal should always be lubricated before assembling in order to have easier insertion of the rod. For further information please refer to the installation instructions on page 63.

* in conformità alle norme ISO/DIN 5597 e ISO 5597/1 - in accordance with ISO/DIN 5597 and ISO 5597/1 norms

Nota: altre dimensioni non a catalogo a richiesta. Consultare il nostro ufficio tecnico.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

RLF®

TENUTA STELO TIPO RLF®

Descrizione

La tenuta tipo RLF® ha un profilo innovativo rispetto alle tradizionali guarnizioni a labbro. Nella parte statica presenta un labbro molto lungo rispetto al labbro dinamico che resta vicino al fondo sede. In questo modo si genera pochissimo attrito in esercizio e il labbro si autoallinea perfettamente allo stelo. La base della guarnizione, sia nella parte dinamica sia in quella statica, ha due grossi raggi che facilitano il montaggio e contemporaneamente non creano spigoli che, sotto pressione, determinerebbero estrusione.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C
 Velocità: < 0.5 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: fluidi a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato e' un poliuretano tipo Co ad alto modulo elastico, basso compression-set ed elevata resistenza all'usura.
 Ha una durezza 93 Sh A ± 2
 Codice materiale: Co

Montaggio

Eliminare bave e spigoli vivi presenti nella sede e sullo stelo per evitare che la guarnizione si danneggi.

Importante: lo stelo deve avere uno smusso di invito molto curato per non rovesciare la guarnizione durante il montaggio. Fare riferimento alla tabella dimensionale qui di seguito per le quote consigliate per lo smusso. È sempre consigliato lubrificare la guarnizione prima del montaggio.

PIPE SEAL TYPE RLF®

Description

The RLF® seal has an innovative profile compared to traditional lip seals. In the static part, the lip is much longer than the dynamic lip and is close to the bottom of the housing. The friction thus generated during operation is very low and there is perfect auto-alignment with the rod. Two wide radii at the bottom of the seal, both in the dynamic and in the static section, considerably ease assembly and, at the same time, no edges develop under pressure, which would be a cause for extrusion. The contact surface at the bottom of the seal shows some roughness which, together with the notches, release the pressure generated by possible pumping movements.

Technical data

Pressure: < 400 bar, at a temperature of 60° C
 Speed: < 0.5 m/s
 Temperature: from - 35° C to + 100° C, with peaks up to 110° C
 Fluids: mineral fluids
 (see table 3, page 14)

Material

*The material used is a Co-type polyurethane with high elasticity modulus, low compression-set and high resistance to wear.
 The hardness is 93 Sh A ± 2
 Compound reference: Co*

Assembling

To prevent any damage to the seal, remove any flash and sharp edges in the housing and on the rod.

Warning: the rod needs a very accurate lead-in chamfer in order not to distort the seal during assembly. Please refer to the dimensional table below for the recommended dimensions for the lead-in chamfer. The seal should always be lubricated before assembly.

Fig. 26- Pic.26:

RSB

TENUTA STELO TIPO RSB

Descrizione

La guarnizione tipo RSB è molto simile al tipo RSA ma sul lato dinamico, ossia sul diametro interno, presenta due labbri con più funzioni:

- attenua eventuali fenomeni di stick-slip grazie al fluido trattenuto nell'intercapedine fra i due labbri
- evita l'entrata di impurità dall'esterno
- contrasta il ritiro del materiale alle basse temperature
- funge da stabilizzatore.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C
 Velocità: < 0.5 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: fluidi idraulici a base minerale (v. tabella 3 a p. 14)

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set ed elevata resistenza all'abrasione.

Ha un durezza di 93 Shore A ± 2.

Codice materiale: Co

Montaggio

Eliminare bave e spigoli taglienti presenti nella sede e sullo stelo per evitare che la guarnizione si danneggi. È sempre consigliato lubrificare la tenuta prima del montaggio per agevolare l'inserimento dello stelo.

Per ulteriori informazioni leggere le istruzioni a p. 63.

RSB TYPE ROD SEAL

Description

The RSB seal type is similar to the RSA type, but on the dynamic side, it presents a multifunctional double lip which:

- reduces stick-slip effects thanks because it keeps oil between the secondary lip and the main one
- stops any external impurities
- faces the material shrinkage at low temperatures
- acts as a stabilizer.

Technical data

Pressure: < 400 bar at a temperature of 60° C
 Speed: < 0.5 m/s
 Temperature: from - 35° C to + 100° C with peaks till 110° C
 Fluids: mineral hydraulic fluids (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.

The hardness is 93 Shore A ± 2.

Compound reference: Co

Assembling

To prevent any damage to the seal, remove any flash and cutting edges in the housing and on the rod.

The seal should always be lubricated before assembling in order to have easier insertion of the rod.

For further information please refer to the installation instructions on page 63.

RSB2

TENUTA STELO TIPO RSB2

Descrizione

La tenuta stelo RSB2 è molto simile alla tenuta RSB con l'aggiunta di un anello antiestrusione. Si utilizza questa tenuta quando non è possibile ridurre i giochi di accoppiamento tra la testata e lo stelo e dove esistono picchi di pressione elevata.

Dati tecnici

Pressione: <400 bar con punte a 500 bar alla temperatura di 60°C

Velocità: <0.5 m/s

Temperatura: da -35°C a +100°C con punte fino a +110°C

Fluidi: fluidi idraulici a base minerale (v. tabella 3 a p. 14)

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set ed elevata resistenza all'abrasione. Ha una durezza di 93 Shore A±2.

Per l'anello antiestrusione è proposta una resina poliacetalica (Ro) con elevata resistenza al carico di rottura.

Codice materiale: CR

Montaggio

Eliminare bave e spigoli taglienti presenti nella sede e sullo stelo per evitare che la guarnizione si danneggi. È sempre consigliato lubrificare la tenuta prima del montaggio per agevolare l'inserimento dello stelo. Per ulteriori informazioni leggere le istruzioni a p. 63.

RSB2 TYPE ROD SEAL

Description

The RSB2 seal type is similar to the RSB type with anti-extrusion ring. This seal is recommended when the coupling clearance between the head and the rod cannot be reduced and in the event of high pressure peaks.

Technical data

Pressure: <400 bar with peaks till 500 bar At 60°C

Speed: < 0.5 [m/s]

Temperature: -35 °C ÷ +100 °C with peaks till +110°C

Fluids: mineral hydraulic fluids (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.

The hardness is 93 Shore A ± 2.

The material proposed for the antiextrusion ring is polyacetal resin (Ro) with haight resintence to breaking load

Material code:CR

Assembling

To prevent any damage to the seal, remove any flash and cutting edges in the housing and on the rod.

The seal should always be lubricated before assembling in order to have easier insertion of the rod.

For further information please refer to the installation instructions on page 63.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

BLF®

TENUTA STELO TIPO BLF®

Descrizione

La tenuta stelo BLF® riduce significativamente sia la temperatura di funzionamento della tenuta che il rischio di estrusione successivo, grazie al suo profilo unico e innovativo.

Le protrusioni presenti sulla superficie di scorrimento interna della guarnizione diminuisce l'area di contatto, riducendo a sua volta l'attrito e spostando la base della guarnizione al di fuori del gioco di accoppiamento, riducendo al minimo il rischio di estrusione. L'aggiunta del canale davanti al labbro di tenuta primario, non solo riduce l'area di contatto, ma consente inoltre di catturare l'olio all'interno della superficie di scorrimento, creando una camera d'olio per lubrificare il labbro di tenuta.

Dati tecnici

Pressione: <400 bar con punte a 500 bar alla temperatura di 60°C
 Velocità: <0.5 m/s
 Temperatura: da - 35°C a +100°C con punte fino a +110°C
 Fluidi : fluidi idraulici a base minerale (v. tabella 3 a p. 14)

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set ed elevata resistenza all'abrasione.
 Ha una durezza di 93 Shore A±2.

Montaggio

Eliminare bave e spigoli taglienti presenti nella sede e sullo stelo per evitare che la guarnizione si danneggi. È sempre consigliato lubrificare la tenuta prima del montaggio per agevolare l'inserimento dello stelo.

BLF® TYPE ROD SEAL

Description

The BLF® seal Type significantly reduces both the operating temperature of the seal and subsequent extrusion risk, due to its unique and innovative profile.

The feature present on the internal sliding face of the seal decreases the contact area, in turn reducing friction and removing the base of the seal from the clearance gap minimising extrusion risk.

The addition of the channel feature not only reduces the contact area, but also allows oil to be captured within the sliding surface in front of the primary sealing lip, creating an oil chamber to lubricate the sealing lip allowing for smooth linear action.

Technical data

Pressure: <400 bar with peaks until 500 bar At 60°C
 Speed : < 0.5 [m/s]
 Temperature: - 35 °C ÷ +100 °C with peaks until +110°C
 Fluids : mineral based hydraulic fluids (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.
 The hardness is 93 Shore A ± 2.

Assembling

To prevent any damage to the seal during assembly, remove all swarf and sharp edges within the housing and corresponding rod. The seal should always be lubricated before assembling in order to have easier insertion of the rod.

Fig. 27 - Pic.27:

BLF®

NO ANELLO ANTIESTRUSIONE

Grazie al suo profilo unico, BLF® elimina la necessità di un anello antiestrusione aggiuntivo. Una combinazione della larghezza ridotta della base, delle protrusioni interne e di un raggio elevato assicura che il materiale si trovi sempre al di fuori del gioco di accoppiamento delle sedi.

NO BACKUP RING

Due to its unique profile, BLF® eliminates the need for an additional anti-extrusion component. A combination of the reduced base width, stud features and large radius, ensures the base material is not located near the housing clearance gap, thus significantly reducing the risk of extrusion.

Fig. 28 - Pic.28: BLF® montaggio/ BLF® installation

300	0,30	0,10
400	0,20	0,05

BLF®

BASSO ATTRITO

Una superficie di contatto ridotta, anche quando la guarnizione è soggetta a pressione, riduce significativamente l'attrito sviluppato dalla tenuta durante il funzionamento. Inoltre, la camera di olio creata dal canale assicura che il labbro di tenuta sia lubrificato in modo permanente per un funzionamento regolare e un attrito inferiore.

LOW FRICTION

A reduced contact surface, even when the seal is subject to pressure, significantly reduces the friction developed by the seal during operation. Furthermore, the oil gap created by the channel features, ensures the sealing lip is permanently lubricated for smooth operation and lower friction

Fig. 31 - Pic.31: PRESSURE / OPERATING FRICTION

Ampi test mostrano una riduzione dell'attrito operativo di circa un 50% misurato in un intervallo di pressione da 0 a 400 [Bar]

Extensive test shows a reduction in operational friction approximately 50% measured in a pressure range from 0 to 400[Bar]

RSC

TENUTA STELO TIPO RSC

Descrizione

La guarnizione tipo RSC è realizzata con ingombri limitati e per cilindri che presentano variazioni di pressione e velocità elevate. Il profilo, progettato con una gola poco profonda, garantisce un forte contatto tra parti statiche e parti dinamiche anche in assenza di pressione.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C
 Velocità: < 0.5 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: fluidi e oli minerali
 (v. tabella 3 a p. 14)

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set, alta resistenza all'abrasione.
 Ha una durezza di 93 Shore A ± 2.
 Codice materiale: Co

Montaggio

Eliminare bave e spigoli taglienti nella sede e sullo stelo per evitare che le guarnizioni si danneggino durante il montaggio.
 È consigliabile lubrificare la tenuta durante il montaggio per agevolare l'inserimento dello stelo.
 Per ulteriori informazioni leggere le istruzioni a p. 63.

RSC TYPE ROD SEAL

Description

The RSC seal has small dimensions and has been developed for cylinders used in presence of pressure variation and high speed.
 The profile has been designed with a shallow groove to ensure tight contact between the static and dynamic part, even in zero pressure situations.

Technical data

Pressure: < 400 bar at a temperature of 60° C
 Speed: < 0.5 m/s
 Temperature: from - 35° C to + 100° C, with peaks till 110° C
 Fluids: mineral oils and fluids
 (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.
 The hardness is 93 Shore A ± 2.
 Compound reference: Co

Assembling

To prevent and damage to the seal, remove any flash and cutting edges in the housing and on the rod.
 The seal should always be lubricated before assembling in order to have easier insertion of the rod.
 For further information please refer to the installation instructions on page 63.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

RSD

TENUTA STELO TIPO RSD

Descrizione

La guarnizione tipo RSD è molto simile al tipo RSC ma sul lato dinamico, ossia sul diametro interno, presenta due labbri che hanno più di una funzione:

- attenua eventuali fenomeni di stick-slip grazie al fluido trattenuto nell'intercapedine fra i due labbri
- evita alle impurità di entrare dall'esterno
- contrasta il ritiro del materiale alle basse temperature
- funge da stabilizzatore.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C

Velocità: < 0.5 m/s

Temperatura: da - 35° C a + 100° C con punte fino a 110° C

Fluidi: fluidi e oli minerali
(v. tabella 3 a p. 14)

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set, alta resistenza all'abrasione.

Ha una durezza di 93 Shore A ± 2.

Codice materiale: Co

Montaggio

Eliminare bave e spigoli taglienti nella sede e sullo stelo per evitare che le guarnizioni si danneggino durante il montaggio. È consigliabile lubrificare la tenuta durante il montaggio per agevolare l'inserimento dello stelo.

Per ulteriori informazioni leggere le istruzioni a p. 63.

RSD TYPE ROD SEAL

Description

The RSD seal type is similar to the RSC type, but on the dynamic side, it presents a multifunctional double lip which:

- reduces stick-slip effects thanks because it keeps oil between the secondary lip and the main one
- stops any external impurities
- faces the material shrinkage at low temperatures
- acts as a stabilizer.

Technical data

Pressure: < 400 bar at a temperature of 60° C

Speed: < 0.5 m/s

Temperature: from - 35° C to + 100° C with peaks till 110° C

Fluids: mineral fluids and oils
(see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.

The hardness is 93 Shore A ± 2.

Compound reference: Co

Assembling

To prevent any damage to the seal, remove any flash and cutting edges in the housing and on the rod. The seal should always be lubricated before assembling in order to have easier insertion of the rod.

For further information please refer to the installation instructions on page 63.

Nota: altre dimensioni non a catalogo a richiesta. Consultare il nostro ufficio tecnico.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

RPO

TENUTA STELO TIPO RPO

Descrizione

La tenuta stelo tipo RPO è caratterizzata dalla presenza di un o-ring, alloggiato nella gola interna tra il labbro dinamico e quello statico, che ha la funzione di energizzare i labbri per garantire la tenuta anche a basse pressioni. Questo profilo garantisce una tenuta perfetta anche in presenza di carichi laterali. L'o-ring può essere fornito in diverse mescole, in base alle temperature di utilizzo.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C

Velocità: < 0.5 m/s

Temperatura: da - 35° C a + 100° C con punte fino a 110° C

Fluidi: fluidi e oli minerali
(v. tabella 3 a p. 14)

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set, alta resistenza all'abrasione.

Ha una durezza di 93 Shore A ± 2.

O-Ring standard è proposto in materiale NBR 75 Shore A, in alternativa può essere fornito anche in materiali quali FKM o HNBR

Codice materiale: CN

Montaggio

Il montaggio avviene in cava anulare. Eliminare le bave e gli spigoli taglienti nella sede e sullo stelo per evitare che si danneggino le guarnizioni durante il montaggio. È consigliabile lubrificare la tenuta durante il montaggio per agevolare l'inserimento dello stelo. Per ulteriori informazioni leggere le istruzioni a p. 63.

RPO TYPE ROD SEAL

Description

The rod seal type RPO is characterized by the presence of an O-ring fit in the internal groove between the dynamic lip and the static one, which has the function to energize the sealing lips to ensure the seal even at low pressures. This profile ensures a perfect seal even in the presence of lateral loads. The O-ring can be provided in different compounds, depending on the temperature of use.

Technical data

Pressure: < 400 bar at a temperature of 60° C

Speed: < 0.5 m/s

Temperature: from - 35° C to + 100° C with peaks till 110° C

Fluids: mineral fluids and oils
(see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.

The hardness is 93 Shore A ± 2.

Standard O-Ring proposed is in NBR 75 Shore A material, or could be equipped in alternative material like FKM or HNBR

Compound reference: CN

Assembling

To prevent any damage to the seal, remove any flash and cutting edges in the housing and on the rod.

The seal should always be lubricated before assembling in order to have easier insertion of the rod.

For further information please refer to the installation instructions on page 63.

Alexander Spring®

MOLLA TIPO AS

Descrizione

Artic Alexander Spring® è il nuovo concetto innovativo di molla energizzante per tenute stelo idrauliche, in applicazioni molto gravose e in condizioni climatiche estreme:

Alexander Spring® sostituisce due concetti energizzanti principali attualmente sul mercato:

- O-ring o Q-ring, in diversi materiali elastomerici (soluzione più comune)
- Molle di metallo (che sono normalmente costose e difficili da produrre)

Grazie alla combinazione del giusto poliuretano e della Alexander Spring®, Artic Seals può garantire una tenuta ad alte prestazioni su un'ampia gamma di temperature.

Dati tecnici

Pressione: < 400 bar

Velocità: < 0.5 m/s

Temperatura:

- da - 50° C a + 90° C in combinazione con poliuretano BT (v. tabella 4 a p. 19)
- da - 30° C a + 135° C in combinazione con poliuretano GT (v. tabella 4 a p. 19)

Fluidi: fluidi e oli minerali
(v. tabella 3 a p. 14)

Materiale

Il materiale proposto è Tecnopolimero ad alta tecnologia e prestazioni, il quale garantisce resistenza ed elasticità in un intervallo veramente ampio di temperatura, da -50° a + 150°C.

Montaggio

Il montaggio avviene in cava anulare. Eliminare le bave e gli spigoli taglienti nella sede e sullo stelo per evitare che si danneggino le guarnizioni durante il montaggio. È consigliabile lubrificare la tenuta durante il montaggio per agevolare l'inserimento dello stelo. Per ulteriori informazioni leggere le istruzioni a p. 63.

AS TYPE SPRING

Description

Artic Alexander Spring® is the new innovative concept in energizing spring for hydraulic rod seals, in very heavy duty applications and extreme climatic conditions:

Alexander Spring® replace two energizing concepts normally the market has:

- O-Rings or Q-Rings, in different elastomeric material (most common solution)
- Metal springs (which are normally expensive and slow to produce)

Thanks to the combination of the correct polyurethane and the Alexander Spring®, Artic Seals can ensure a high performance seal over a wide range of temperature.

Technical data

Pressure: < 400 bar

Speed: < 0.5 m/s

Temperature:

- from - 50° C to + 90° C combined with polyurethane BT (see table 4, page 19)
- from - 30° C to + 135° C combined with polyurethane GT (see table 4, page 19)

Fluids: mineral fluids and oils
(see table 3, page 14)

Material

The proposed material is a very high performance and technologic Tecnopolimer, which ensures high elasticity and resistance in a very wide range of temperature from -50° up to 150°C.

Assembling

To prevent any damage to the seal, remove any flash and cutting edges in the housing and on the rod. The seal should always be lubricated before assembling in order to have easier insertion of the rod.

For further information please refer to the installation instructions on page 63.

RSBI / RPOI

TENUTE STELO TIPO RSBI / RPOI

Descrizione

La gamma standard di Artic Seals riguardo le tenute stelo per idraulica in POLLICI presente le due famiglie tipo RSBI e RPOI

RSBI: progettata con labbro dinamico più corto rispetto a quello statico, ha impieghi dove risultano elevati i disallineamenti dello stelo e dove le pressioni possono raggiungere valori elevati, presenta sul lato dinamico un doppio labbro che ha più di una funzione:

- attenua eventuali fenomeni di stick-slip grazie al fluido trattenuto nell'intercapedine fra i due labbri;
- evita alle impurità di entrare dall'esterno;
- contrasta il ritiro del materiale alle basse temperature;
- funge da stabilizzatore.

RPOI: è caratterizzata dalla presenza di un O-Ring alloggiato nella gola interna tra il labbro dinamico e quello statico, il quale ha la funzione di energizzare i labbri per garantire la tenuta anche a basse pressioni. Questo profilo garantisce una tenuta perfetta anche in presenza di carichi laterali. L'O-Ring può essere fornito in diverse mescole, in base alle temperature di utilizzo.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C
 Velocità: < 0,5 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: fluidi a base minerale

Materiale

Il materiale proposto è Co: TPU durezza 94Shore A.
 RPOI: L'o-ring in NBR 70 Shore A. (No).
 Codice materiale: CN.

Montaggio

Il montaggio avviene in cava anulare.
 Per evitare che si danneggino le guarnizioni durante il montaggio occorre eliminare le bave e gli spigoli taglienti nella sede e sullo stelo.
 E' consigliabile lubrificare la tenuta durante il montaggio per agevolare l'inserimento dello stelo.

RSBI / RPOI TYPE ROD SEAL

Description

Artic Seals standard range of hydraulic rod seals in INCH SIZES is represented by two sealing groups; RSBI and RPOI seal types.

RSBI: has a dynamic lip shorter than the static one and it is used in cases of high rod misalignments and possible high pressure, on the dynamic side, it presents a multifunctional double lip which:

- reduces stick slip effects because it retains oil between the secondary lip and primary lip;
- stops any external impurities;
- faces the material shrinkage at low temperatures;
- acts as a stabilizer.

RPOI is characterized by the installation of an O-Ring within the internal groove between both the static and dynamic sealing lips to ensure the seal is permanently energized even at low system pressure. This profile ensures a perfect seal even in the presence of lateral loads. The O-ring can be provided in different compounds, depending on the temperature of use.

Technical data

Pressure: < 400 bar at a temperature of 60° C
 Speed: < 0,5 m/s
 Temperature: from - 35° C to + 100° C, with peaks at 110° C
 Fluids: mineral-based fluids

Material

Material proposed is Co: TPU 94 Shore A hardness.
 RPOI: O-ring in NBR 70 Shore A (No).
 Compound reference: CN.

Assembling

To prevent any damage to the seal during assembly, remove all swarf and sharp edges within the housing and corresponding rod. The seal should always be lubricated before assembling in order to have easier insertion of the rod.

ANELLI ANTIETRUZIONE TIPO RAA

Descrizione

Gli anelli antiestrusione sono utilizzati a supporto della guarnizione, dove il gioco di accoppiamento tra la testata e lo stelo risulta ampio e le pressioni di esercizio molto elevate (superiore a 250 bar).

Dati Tecnici

Pressione: < 600 bar
 Velocità: < 1 m/s
 Temperatura: da - 30° C a + 100° C
 Fluidi: fluidi e oli minerali
 (v. tabella 3 a p. 14)

Materiale

Il materiale standard è resina acetlica POM
 Codice materiale: R2

Montaggio

Il montaggio può avvenire in sede anulare con anello tagliato o anello intero.

RAA TYPE ANTIEXTRUSION RING

Description

The anti-extrusion rings are used to support the gasket, where the coupling clearance between the cylinder head and the stem is wide and the operating pressures are very high (over 250 bar).

Technical data

Pressure: < 600 bar
 Speed: < 1 m/s
 Temperature: from - 30° C up to + 100° C
 Fluid: mineral fluids and oils
 (see table 3, page 14)

Material

Standard material is acetalic resin POM
 Compound reference: R2

Assembling

Assembling can be in the annular groove ring with cut or whole ring.

TSS / P

TENUTA STELO TIPO TSS/P

Descrizione

La TSS/P è una guarnizione in materiale poliuretano di durezza di 60 Sh D per stelo a semplice effetto, energizzata con o-ring in NBR. Le dimensioni delle sedi sono intercambiabili con le TSS. È utilizzata sia come guarnizione primaria sia come secondaria (tandem).

È consigliato montare la TSS/P con un raschiatore bidirezionale poiché il profilo permette il rientro nel cilindro dell'olio (blow-by).

L'utilizzo è su cilindri con pressioni elevate e frequenti colpi d'ariete.

Dati Tecnici

Pressione: < 600 bar

Velocità: < 5 m/s

Temperatura: da - 30°C a + 110°C, con punte per periodi brevi fino a 120°C.

Fluidi: fluidi e oli minerali
(v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato è un poliuretano poliesteri di durezza 60 Sh D.

Codice materiale: EN

Montaggio

Il montaggio avviene in cava anulare chiusa. L'elasticità del materiale favorisce l'inserimento in sede. Togliere le bave di lavorazione meccanica per non rovinare la guarnizione.

Per ulteriori informazioni leggere le istruzioni a p. 63

TSS / P TYPE ROD SEAL

Description

The TSS / P is a Polyurethane 60 Shore D seal for a simple acting rod energized with an NBR O-Ring.

The dimensions of the groove are interchangeable with the TSS. This type of seal is used both as a primary that as a secondary seal (tandem).

Recommended use the TSS / P with a bidirectional wiper because the profile allows the return oil into the cylinder (blow-by).

The common use is on a cylinders that have high pressure and frequent water hammer.

Technical data

Pressure: < 600 bar

Speed: < 5 m/s

Temperature: from - 30°C up to + 110°C
with short peaks till 120°C

Fluid: mineral fluids and oils
(see table 3, page 14)

Material

The material is a polyurethane 60 Sh D hardness
Compound reference: EN

Assembling

Installation is in the annular recess closed.

The elasticity of the material favors the inclusion in the seat. Remove burrs from machining, to avoid damaging the seal.

For further information please refer to the installation instructions on page 63.

TSS

TENUTA STELO TIPO TSS

Descrizione

La tenuta stelo tipo TSS consta di un anello in PTFE opportunamente sagomato e caricato bronzo, avente funzione di tenuta dinamica, e di un anello o-ring che effettua la tenuta statica e contemporaneamente svolge un effetto energizzante.

Dati Tecnici

Pressione: < 600 bar

Velocità: < 15 m/s

Temperatura: per il tipo standard con OR in nitrile da - 30°C a + 100°C, con punte per periodi brevi fino a 120°C.

Per range di temperature differente occorre sostituire l'o-ring con un altro tipo più idoneo.

Materiale

Per il tipo standard PTFE isostatico caricato bronzo e o-ring in nitrile.

Codice materiale: TN

Per applicazioni fino a <250 bar è possibile utilizzare materiale alternativo PTFE estruso caricato bronzo

Codice materiale : TM2

Montaggio

- Le guarnizioni in PTFE necessitano di precauzioni estremamente rigorose, maggiori che per tutte le altre tipologie di tenuta. È fondamentale eliminare gli spigoli vivi e le bave nelle sedi. Il montaggio delle guarnizioni per lo stelo segue normalmente questa sequenza:
- installare l'o-ring nella sede
- deformare l'anello in PTFE con l'ausilio di un mandrino e una bussola a espansione
- calibrare con una bussola opportunamente dimensionata (p. 64).

TSS TYPE ROD SEAL

Description

The TSS rod seal is composed of two rings. The dynamic seal is a ring in bronze filled PTFE while the static seal is an O-Ring also acting as energizer.

Technical data

Pressure: < 600 bar

Speed: < 15 m/s

Temperature: from - 30°C up to + 100°C for the standard type with nitrile OR. Short peaks till 120°C. For a different temperature range, the O-Ring should be replaced by a more suitable model.

Material

Bronze-filled isostatic PTFE for the standard type, and is NBR (Nitrile butadiene rubber) O-Ring.

Compound reference: TN

For applications until <250 bar is possible to use alternative material Bronze-filled extruded PTFE

Compound reference: TM2

Assembling

PTFE seals require careful assembling operations in comparison to other types of seals. It is necessary to remove flashes and/or cutting edges in the grooves. The rod seal is usually assembled in the following sequence:

- fit the O-Ring into the groove
- twist the PTFE ring using a mandrel and a expansion bush
- calibrate with a plastic conical tool (Page 64).

RSO

TENUTA STELO TIPO RSO

Descrizione

La tenuta tipo RSO è stata sviluppata per sostituire e/o lavorare in tandem con guarnizioni a gradino in PTFE, viste le identiche dimensioni di sede, ed è dotata di una gola arrotondata interna dove si può alloggiare un o-ring per energizzare il labbro di tenuta dinamico e quello statico anche in assenza di pressione.

Questo profilo può essere utilizzato anche a bassissime velocità e pressioni con risultati eccellenti per il basso attrito sviluppato. Presenta ridotti ingombri assiali e quindi lavorazioni di sede estremamente semplici.

Dati tecnici

Pressione: < 250 bar a temperatura di 60° C
 Velocità: < 0.5 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale proposto per la tenuta è il poliuretano tipo Co ad alto modulo elastico (standard 93 Sh A), basso compression-set ed elevata resistenza all'abrasione energizzato da un o-ring in NBR 70 (No).

Codice materiale: CN

Montaggio

Eliminare le bave e gli spigoli taglienti come per tutte le sedi dove alloggia la guarnizione.
 Per ulteriori informazioni leggere le istruzioni a p. 63.

RSO TYPE ROD SEAL

Description

The RSO seal type has been developed to replace or work jointly with stepseals in PTFE, because of the same groove dimension.

Internally it has a round groove where an O-ring can be housed. The O-Ring acts as energizer for the static and dynamic sealing lips even without pressure.

This profile has also excellent results at very low speed and pressure, because of the low friction. The machining of the groove is easier thanks to the reduced axial dimension.

Technical data

Pressure: < 250 bar at a temperature of 60° C
 Speed: < 0.5 m/s
 Temperature: from - 35° C to + 100° C, with peaks till 110° C
 Fluids: mineral oils (see TABLE I, pages 12-13)
 (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.

The hardness is 93 Shore A \pm 2, energized with O-ring in NBR 70 (No).

Compound reference: CN

Assembling

As for all seal housings, remove any flash or cutting edges.

For further information please refer to the installation instructions on page 63.

* in conformità alle norme ISO/DIN 5597 e ISO 5597/1 – in accordance with ISO/DIN 5597 and ISO 5597/1 norms

(1) = per RSO con sezione 3,75 mm non viene fornito con o-ring – for cross section 3.75mm RSO is supplied without o-ring

(2) = si consiglia la sede aperta per facilitare montaggio – open groove housing is recommended for easier installation

RBR

BUFFER RING TIPO RBR

Descrizione

L'anello RBR, avente funzione di buffer ring, è stato appositamente progettato come guarnizione primaria per lavorare esclusivamente in tandem con tenute a labbri asimmetrici (v. RSA p. 30).

La sua funzione è quella di permettere alla tenuta secondaria di lavorare comunque in pressione. Non effettuando una tenuta assoluta tra le due guarnizioni si crea una camera d'olio con pressione crescente che si libera, raggiunto un certo valore, all'interno del cilindro grazie al particolare profilo dell'anello RBR. L'insieme funziona come una valvola di massima e ha il compito di contrastare i picchi di pressione.

Dati tecnici

Pressione: < 400 bar a temperature di 60° C
 Velocità: < 0.8 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: oli minerali HL e HLP
 (v. tabella 3 a p.14)

Materiale

Il materiale proposto è il poliuretano tipo Co a 93 Shore A con buona resistenza all'abrasione, ottimo compression-set, elevato modulo elastico necessario per la tenuta.

Per l'anello antiestrusione è proposta una resina termoplastica (L7) con elevata resistenza al carico di rottura.

Codice materiale: CL

Montaggio

Il montaggio avviene in cava chiusa.

Montare prima la guarnizione in poliuretano e poi l'anello antiestrusione.

Per ulteriori informazioni leggere le istruzioni a p. 63.

RBR TYPE BUFFER RING

Description

The RBR ring, working as buffer ring, has been specially designed to work as main seal, to be used in combination with asymmetrical lip seals (see RSA, page 30).

Its function is to maintain working pressure for the second seal. It does not provide full sealing effect so an oil chamber will thus form between the two seals. Thanks to the special profile of the RBR ring, the growing pressure in the space will be released into the cylinder once a certain value is achieved. It works as a valve.

It has been also designed to compensate pressure peaks.

Technical data

Pressure: < 400 bar at a temperature of 60° C
 Speed: < 0.8 m/s
 Temperature: from - 35° C to + 100° C with peaks till 110° C
 Fluids: HL and HLP mineral oil
 (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, fundamental for the sealing, low compression-set and high abrasion resistance.

The hardness is 93 Shore A \pm 2. The material proposed for the anti-extrusion ring is a thermoplastic resin (L7) with high tensile strength.

Compound reference: CL

Assembling

The assembling is done in closed groove. The polyurethane seal must therefore be fitted before the anti-extrusion ring.

For further information please refer to the installation instructions on page 63.

Nota: altre dimensioni non a catalogo a richiesta. Consultare il nostro ufficio tecnico.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

RSS

TENUTA STELO TIPO RSS

Descrizione

La tenuta stelo tipo RSS è stata progettata come guarnizione primaria, a semplice effetto o a doppio effetto.

L'O-ring effettua tenuta statica, allo stesso tempo energizza il pattino in poliuretano, il quale svolge la tenuta dinamica.

Il profilo a doppia cresta, grazie anche all'energizzazione dell'OR, permette la tenuta anche a basse pressioni, mentre il piano centrale del profilo aiuta a mantenere allineato il sistema fornendo un ulteriore punto di appoggio alle guide. Questa tipologia di profilo non consente l'effetto Blow-by, di conseguenza è consigliato esclusivamente l'utilizzo di un raschiatore a unidirezionale.

Dati Tecnici

Pressione:	< 250 bar con materiale standard 93 Shore A a 60°C (Co)
Pressione:	< 400 bar con materiale alternativo 98 Shore A a 60°C (Do)
Pressione:	< 500 bar con materiale alternativo 60 Shore D a 60°C (Eo)
Velocità:	< 0,8 m/s
Temperatura:	da - 30°C a + 110°C, con punte per periodi brevi fino a 120°C.
Fluidi:	fluidi e oli minerali (v. tabella 3 a p. 14)

Materiale

I materiali proposti sono TPU di diverse durezza seconda delle pressioni di esercizio (Co/Do/Eo) O-ring in NBR 70 (No).

Codice materiale: CN (o in alternativa DN/ EN)

Montaggio

Il montaggio avviene in cava anulare chiusa. L'elasticità del materiale favorisce l'inserimento in sede. Togliere le bave di lavorazione per non rovinare la guarnizione. Per ulteriori informazioni leggere le istruzioni a pag. 63

RSS TYPE ROD SEAL

Description

The RSS-type rod seal has been designed as a primary seal, single or double-acting seal.

The O-ring performs a static seal, at the same time energizing the polyurethane slipper, which performs the dynamic seal.

The double peaks profile, thanks also to the energization of the OR, allows the sealing even at low pressures, while the central plane of the profile helps to keep the system aligned, providing an additional support point to the wear rings.

This type of profile doesn't allow the Blow-by effect, therefore it is only recommended to use a unidirectional scraper.

Technical data

Pressure:	< 250 bar with standard material 93 Shore A a 60°C (Co)
Pressure:	< 400 bar with alternative material 98 Shore A a 60°C (Do)
Pressure:	< 500 bar with alternative material 60 Shore D a 60°C (Eo)
Speed:	< 0,8 m/s
Temperature:	from - 30°C up to + 110°C with short peaks till 120°C
Fluid:	mineral fluids and oils (see table 3, page 14)

Material

Material proposed are TPUs with different hardness according to the working pressure O-ring in NBR 70 (No).

Compound reference: CN (or in alternative DN/EN)

Assembling

Installation is in the annular recess closed.

The elasticity of the material favors the inclusion in the seat. Remove burrs from machining, to avoid damaging the seal. For further information please refer to the installation instruction on page 63

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

RPS

TENUTA STELO / PISTONE TIPO RPS

Descrizione

La guarnizione tipo RPS, grazie al profilo simmetrico, può essere utilizzata per tenuta su stelo, su pistone e per cilindri che lavorano a semplice o a doppio effetto. Il profilo a labbri uguali e la profondità della gola garantiscono una frizione ridotta e un movimento lineare anche a bassa pressione.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C
 Velocità: < 0,5 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: oli idraulici minerali
 (v. tabella 3 a p. 14)

Materiali

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set e buona resistenza all'abrasione.
 Ha una durezza di 93 Shore A ± 2.
 Codice materiale: Co

Montaggio

Il montaggio è facilitato dall'alto modulo elastico del poliuretano.

- Ingrassare la guarnizione
- togliere spigoli e bave che danneggerebbero la tenuta.

Per ulteriori informazioni leggere le istruzioni a p. 63.

RPS TYPE ROD/PISTON SEAL

Description

The RPS seal type, due to its symmetrical profile, it can be used both for rod and piston sealing applications and for cylinders working with simple or double effect. The profile with equal lips and the deep groove ensures low friction and a linear movement even at low pressure.

Technical data

Pressure: < 400 bar at a temperature of 60° C
 Speed: < 0,5 m/s
 Temperature: from - 35° C to + 100° C, with peaks till + 110° C
 Fluids: mineral hydraulic oils
 (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, fundamental for the sealing, low compression-set and high abrasion resistance. The hardness is 93 Shore A ± 2. Compound reference: Co

Assembling

The high modulus of elasticity of the polyurethane helps the assembling.

- *It is recommended to lubricate the seals before installation*
- *eliminate any edges or flash which could damage the seal.*

For further information please refer to the installation instructions on page 63.

Per diametri superiori a 200mm sono disponibili le tenute tipo MAD e tipo CSC della Macma, programma dimensioni a pag. 328.
Seals type MAD and type CSC, produced by Macma, are available for diameters bigger than 200 mm, program range at page 328

* in conformità alle norme ISO/DIN 5597 e ISO 5597/1 – in accordance with ISO/DIN 5597 and ISO 5597/1 norms

** diametro di aggancio consigliato ma modificabile in funzione delle esigenze di montaggio – hook diameter which could be modified according to mounting demand

PSA

TENUTA PISTONE TIPO PSA

Descrizione

La guarnizione tipo PSA è stata realizzata per impieghi su pistone e può essere utilizzata sia per il semplice sia per il doppio effetto. Ha labbri asimmetrici che assicurano sempre il contatto con la camicia anche in presenza di disallineamenti elevati. Grazie all'alto modulo elastico del materiale, il montaggio avviene in cava semiaperta.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C
 Velocità: < 0.5 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set ed alta resistenza all'usura.
 Ha una durezza di 93 Shore A ± 2.
 Codice materiale: Co

Montaggio

- Lubrificare la tenuta prima del montaggio
- eliminare tutti gli spigoli vivi e le bave sul pistone dove alloggia la guarnizione
- eseguire uno smusso di invito sulla camicia per facilitare l'inserimento del pistone.

Per ulteriori informazioni leggere le istruzioni a p. 63.

PSA TYPE PISTON SEAL

Description

The PSA seal type has been conceived to work on the piston and it can be used for simple or double effect. Its has asymmetrical lips which ensure a continuous contact with the bore, even in case of high misalignments.
 Elastic installation in semi-open groove thanks to the high elastic modulus of the material.

Technical data

Pressure: < 400 bar at a temperature of 60° C
 Speed: < 0.5 m/s
 Temperature: from - 35° C to + 100° C, with peaks till 110° C
 Fluids: mineral-based oils and fuels
 (see table 3, page 14)

Material

The material used is a polyurethane with a high modulus of elasticity, low compression set and high wear resistance.
 Its hardness is 93 Shore A ± 2.
 Compound reference: Co

Assembling

Remove any flash or cutting edges on the piston where the seal is housed.
 Provide a lead-in chamfer in the bore to have an easier piston insertion.
 Lubricate the packing before installation.
 For further information please refer to the installation instructions on page 63.

PAE

TENUTA PISTONE CON ANELLO ANTIESTRUSIONE TIPO PAE

Descrizione

La guarnizione tipo PAE è stata realizzata specificatamente per operare in condizioni di esercizio molto gravose.

Quando i giochi di accoppiamento tra camicia e pistone non possono essere ridotti e la pressione è molto elevata, superiore a 250 bar, la tenuta tipo PAE, grazie ad un robusto anello antiestrusione, risulta tra le più appropriate.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C

Velocità: < 0.5 m/s

Temperatura: da - 35° C a +100° C con punte fino a 110° C

Fluidi: oli a base minerale (v. tabella 3 a p. 14)

Materiale

I materiali utilizzati sono un poliuretano tipo Co a 93 Shore A ad alto modulo elastico per la guarnizione e una resina acetica, tipo Ro rinforzata con fibre di vetro con elevata resistenza al carico di rottura, per l'anello antiestrusione.

Codice materiale: CR

Montaggio

- Lubrificare la tenuta prima del montaggio che avviene in cava semiaperta
- montare la tenuta e poi l'anello antiestrusione
- togliere le bave e gli spigoli vivi sul pistone per non danneggiare la guarnizione durante il montaggio nella fase di accavallamento.

Per ulteriori informazioni leggere le istruzioni a p. 63

PAE TYPE PISTON SEAL WITH ANTIEXTRUSION RING

Description

The PAE seal type is specially designed for heavy duty applications.

When the coupling clearance between bore and piston cannot be reduced and the pressure is very high - above 250 bar - the PAE seal type, thanks to a strong anti-extrusion ring, is among the most appropriate of seal types.

Technical data

Pressure: < 400 bar at a temperature of 60° C

Speed: < 0.5 m/s

Temperature: from - 35° C till +100° C

Fluids: mineral oils
(see table 3, page 14)

Material

The material used for the seal is polyurethane Co-type at 93 Shore A with high elasticity module. The anti-extrusion ring is made of acetal resin Ro-type reinforced with fibreglass and with high tensile strength.

Compound reference: CR

Assembling

- The assembling of this seal is done in semi-open groove
- the anti-extrusion ring should be installed after the seal
- It is important to remove any flash or cutting edge on the piston not to damage the seal during the overlapping.
- Lubricate the packing before installation.

For further information please refer to the installation instructions on page 63.

* diametro di aggancio consigliato ma modificabile in funzione delle esigenze di montaggio

* recommended hook diameter which could be modified according to mounting demand

Nota: altre dimensioni non a catalogo a richiesta. Consultare il nostro ufficio tecnico.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

PSH + RR

TENUTA PISTONE CON ANELLO GUIDA E RITEGNO TIPO PSH + RR

Descrizione

La guarnizione per pistone tipo PSH è simile al tipo PSA ma è provvista di un anello di guida in resina acetale che attenua eventuali disallineamenti e funge da antiestrusione. Un anello di ritegno tipo RR in resina termoplastica previene l'espulsione della tenuta durante l'inversione del ciclo.

Dati tecnici

Pressione: < 400 bar a temperatura di 60° C
 Velocità: < 0.5 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a +110° C
 Fluidi: fluidi e oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, a basso compression-set ed elevata resistenza all'abrasione; l'anello di guida è in resina acetale tipo Ro rinforzata con fibre di vetro.

Codice materiale PSH: CR

L'anello di ritegno è costruito in resina termoplastica tipo R2.

Codice materiale RR: R2

Montaggio

- Lubrificare la tenuta prima del montaggio
- eliminare tutti gli spigoli vivi e le bave sul pistone dove alloggia la guarnizione
- eseguire uno smusso di invito sulla camicia per facilitare l'inserimento del pistone.

Per ulteriori informazioni leggere le istruzioni a p. 63

PSH+RR TYPE PISTON SEAL WITH WEAR AND RETAINING RING

Description

The PSH piston seal type is similar to the PSA type, but it has an acetal resin wear ring to mitigate possible misalignments and avoid extrusion. A RR retaining ring made of thermoplastic resin prevents seal ejection during the cycle inversion.

Technical data

Pressure: < 400 bar at a temperature of 60° C
 Speed: < 0.5 m/s
 Temperature: from - 35° C to + 100° C with peaks till +110° C
 Fluids: mineral fluids and oils
 (see table 3, page 14)

Material

The proposed material is a Co-type polyurethane with high modulus of elasticity, low compression set and high abrasion resistance. The wear ring is made of a Ro-type acetal resin reinforced with fibreglass.

Compound reference PSH: CR

The retaining seal is made of thermoplastic resin, R2 type.

Compound reference RR: R2

Assembling

- Avoid all cutting edges and flash on the piston where the seal is housed
- a lead-in chamfer in the groove will facilitate the piston insertion
- lubricate the seal before installation.

For further information please refer to the installation instructions on page 63.

PSH+RR

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

PSO

TENUTA PISTONE TIPO PSO

Descrizione

La guarnizione tipo PSO ha uno speciale profilo con doppie punte sulla parte dinamica e un piano con due piccoli gradini di contenimento sulla parte statica dove alloggia l'o-ring, che energizza la guarnizione e garantisce la perfetta tenuta a basse e alte pressioni. Il peculiare profilo evita pressioni idrodinamiche sulla tenuta e di conseguenza l'effetto blow-by.

Dati tecnici

Pressione: < 250 bar con materiale standard
93 Sh A a 60° C (Co)

Pressione: < 400 bar con materiale alternativo
98 Sh A a 60° C (Do)

Pressione: < 500 bar con materiale alternativo
60 Sh D a 60° C (Eo)

Velocità: < 0.5 m/s

Temperatura: da - 35° C a + 100° C con punte fino a
110° C

Fluidi: fluidi a base minerale
(v. tabella 3 a p. 14)

Materiale

I materiali proposti sono TPU in differenti durezza a seconda delle pressioni di esercizio (Co/Do / Eo).
O-ring in NBR 70 Shore A. (No).
Codice materiale: CN (o in alternativa DN/EN)

Montaggio

- Eliminare spigoli taglienti e bave nella sede dove alloggia la guarnizione
- eseguire lo smusso di invito sulla camicia per facilitare il montaggio del pistone.

Per ulteriori informazioni leggere le istruzioni a p. 63.

Nota: in caso di finitura da lucido di trafilatura si consiglia l'utilizzo di tenuta pistone in PTFE.

PSO TYPE PISTON SEAL

Description

The PSO seal type shows a double profile on the dynamic side and a surface with two small steps on the static side, where the o-ring is housed. The presence of the o-ring, which energizes the seal, ensures a perfect seal performance at low and high pressure. The special double profile avoids any hydro-dynamic pressure on the sealing part and the consequent blow-by effect.

Technical data

Pressure: < 250 bar with standard material 93 Sh A at 60° C (Co)

Pressure: < 400 bar with alternative material 98 Sh A at 60° C (Do)

Pressure: < 500 bar with alternative material 60 Sh D at 60° C (Eo)

Speed: < 0.5 m/s

Temperature: from - 35° C to + 100° C, with peaks at 110° C

Fluids: mineral-based fluids
(see table 3, page 14)

Material

Material proposed are TPUs with different hardness according to the working pressure (Co / Do / Eo).
O-ring in NBR 70 Shore A (No).
Compound reference: CN (or, in alternative, DN / EN).

Assembling

- Remove any cutting edges and flash in the housing of the seal
- ensure a lead-in chamfer in the bore to facilitate the piston installation.

For further information please refer to the installation instructions page 63.

Note: in case of Bright drawn surface machining it is recommended to use PTFE piston seals.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

PSQ

TENUTA PISTONE TIPO PSQ

Descrizione

La guarnizione PSQ ha uno speciale profilo con doppie punte centrali nella parte dinamica e un piano di due piccoli gradini nella parte statica dove alloggia il q-ring, che energizza la guarnizione e garantisce la perfetta tenuta a bassa e alta pressione. La geometria del profilo evita pressioni idrodinamiche sulla tenuta e di conseguenza l'effetto blow-by.

Dati tecnici

Pressione: < 250 Bar con materiale tipo Co a 93 Shore A a temperatura di 60° C.
< 400 Bar con materiale tipo Do a 98 Shore A a temperatura di 60° C.

Velocità: < 0,8 m/s

Temperatura: da - 35° C a + 100 ° C con punte fino a 110° C.

Fluidi: oli a base minerale (v. tabella 3 a p. 14)

Materiale

I materiali proposti sono TPU di diverse durezza a seconda delle pressioni di esercizio.
Codice materiale: CN (93 Shore A con Q-Ring) o, in alternativa, DN (98 Shore A con Q-Ring)

Montaggio

- Eliminare gli spigoli taglienti e le bave nella sede dove alloggia la guarnizione
- eseguire lo smusso d'invito sulla camicia per facilitare il montaggio del pistone.

Per ulteriori informazioni leggere le istruzioni a p. 63.

Nota: in caso di finitura da lucido di trafilatura si consiglia l'utilizzo di tenuta pistone in PTFE.

PSQ TYPE PISTON SEAL

Description

The PSQ seal has a double point profile in the in the dynamic part, and two small steps in the static part where the Q-ring is housed. The Q-ring energizes the seal and provides a perfect sealing performance at low and high pressure. The shape of the central double profile prevents hydrodynamic pressures on the seal and the resulting blow-out effect.

Technical data

Pressure: < 250 Bar with a Co-type material at 93 Shore A, at a temperature of 60°C.
< 400 Bar a Do-type material, at 98 Shore A, at a temperature of 60° C.

Speed: < 0.8 m/s

Temperature: from - 35° C to + 100 ° C with peaks up to 110° C.

Fluids: mineral oils (see table 3, page 14)

Material

Material proposed are TPUs with different hardness according to the working pressure.
Compound reference: CN (93 Shore A with Q-ring) or, alternatively, DN (98 Shore A with Q-ring)

Assembling

- Cutting edges or flash must be removed in the housing of the seal
- ensure a lead-in chamfer in the bore to facilitate the piston installation.

For further information please refer to the assembly instructions on page 63.

Note: in case of bright drawn surface machining it is recommended to use PTFE piston seals.

PSN

TENUTA PISTONE TIPO PSN

Descrizione

La tenuta pistone tipo PSN è stata studiata per impieghi oleodinamici e pneumatici. Grazie alla sua elasticità è montabile anche su pistone di tipo monoblocco. La sua caratteristica principale è l'eccezionale scorrevolezza che consente l'utilizzo anche con fluidi a basso potere lubrificante come aria e acqua. Innumerevoli test hanno dato esiti positivi sull'assenza di estrusione del profilo anche con passaggio della tenuta sui fori di drenaggio.

Dati Tecnici

Pressione: < 250 bar
 Velocità: < 4 m/s
 Temperatura: - 30° C a + 120° C,
 Fluidi: oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato per l'elemento di tenuta è un tecnopolimero ad alta elasticità, mentre per l'elemento energizzante si utilizza un o-ring in NBR 70 Shore A. In alternativa, per la tenuta è utilizzabile PTFE rinforzato bronzo e un o-ring in materiali quali HNBR o FKM per l'elemento energizzante.

Montaggio

Il montaggio avviene in sede anulare in modo elastico.
 Eliminare le bave di lavorazione meccanica.
 Per ulteriori informazioni leggere le istruzioni a p. 63.

PSN TYPE PISTON SEAL

Description

The PSN type piston seal has been designed for both hydraulic and pneumatic applications. Due to its elasticity can also be assembled on monoblock piston type. Its main characteristic is an exceptional smoothness that allows to use this seal even with low lubricity fluids such as air and water. Many tests have given positive results as regards the absence of extrusion of the profile even with the passage of the seal on the drainage holes of the system.

Technical data

Pressure: < 250 bar
 Speed: < 4 m/s
 Temperature: from - 30° C up to + 120° C
 Fluids: mineral oils
 (see table 3, page 14)

Material

The sealing element's material is a technopolymer with high elasticity, whereas, for the energizing element, it is proposed O-ring in NBR 70 Shore A. Alternative material is bronze filled PTFE for the sealing element and, for the energizing element, O-ring in HNBR or FKM.

Assembling

Elastic installation in annular groove. Remove any machining burrs and lubricate the seal before installation. For further information please refer to the installation instructions on page 63.

TPD

TENUTA PISTONE TIPO TPD

Descrizione

La tenuta pistone tipo TPD è composta da un anello sagomato in PTFE caricato bronzo a basso coefficiente di attrito, che funge da tenuta dinamica, e di un anello o-ring che effettua la tenuta statica e contemporaneamente svolge un effetto energizzante.

Dati Tecnici

Pressione: < 600 bar

Velocità: < 15 m/s

Temperatura: per il tipo standard con o-ring in nitrile da - 30° C a + 100° C, con punte per periodi brevi fino a 120° C.
Per range di temperature differenti occorre sostituire l'o-ring in NBR con materiali più idonei.

Materiale

Per il tipo standard PTFE isostatico caricato bronzo e o-ring in nitrile.

Codice materiale: TN

Per applicazioni fino a <250 bar è possibile utilizzare materiale alternativo PTFE estruso caricato bronzo

Codice materiale : TM2

Montaggio

Le guarnizioni in PTFE necessitano di precauzioni estremamente rigorose, maggiori che per tutte le altre tipologie di tenuta. È fondamentale eliminare gli spigoli vivi e le bave nelle sedi. Il montaggio delle guarnizioni per stelo segue normalmente questa sequenza:

- installare l'o-ring nella sede
- spingere dilatando l'anello in PTFE con l'ausilio di un mandrino e una bussola a espansione
- calibrare con una bussola opportunamente dimensionata (p.64).

TPD TYPE PISTON SEAL

Description

The TPD piston seal is composed of two rings. The dynamic seal is a shaped in bronze filled PTFE with very low friction coefficient. The static seal is an O-Ring also working as energizer.

Technical data

Pressure: < 600 bar

Speed: < 15 m/s

Temperature: from - 30° C up to + 100° C for the standard type with nitrile OR. Short peaks till 120° C. For a different temperature range, the O-Ring in NBR should be replaced by a more suitable material.

Material

Bronze-filled PTFE for the standard type, and NBR for the O-Ring.

Compound reference: TN

For applications until <250 bar is possible to use alternative material Bronze-filled extruded PTFE

Compound reference: TM2

Assembling

PTFE seals require careful assembling operations in comparison to other types of seals It is necessary to remove flashes and/or cutting edges in the grooves. The rod seal is usually assembled in the following Sequence:

- fit the O-Ring into the groove
- twist the PTFE ring using a mandrel and a expansion bush
- calibrate with a bush with right dimension (Pag.64).

PSI

TENUTA PISTONE TIPO PSI

Descrizione

La guarnizione tipo PSI ha un profilo simmetrico che permette la tenuta a doppio effetto. Il profilo ha una cava nella parte interna dove alloggia un o-ring, che energizza la guarnizione, ne garantisce la perfetta tenuta sia a basse che ad alte pressioni grazie anche alla presenza di tacche assiali. Le tacche radiali consentono un effetto anti-incollaggio e di sfiato.

Dati tecnici

Pressione: < 350 bar
 Velocità: < 1 m/s
 Temperatura: da - 35° C a + 100° C con punte fino a 110° C
 Fluidi: fluidi a base minerale

Materiale

Il materiale proposto è Co: TPU durezza 94Shore A. L'o-ring in NBR 70 Shore A. (No).
 Codice materiale: CN.

Montaggio

E' necessario eliminare spigoli taglienti e bave nella sede dove alloggia la guarnizione. Eseguire smusso di invito sulla camicia per facilitare il montaggio del pistone.

Nota: non utilizzare in caso la finitura della camicia sia realizzata da lucido di trafilatura.

Fig. 35 - Pic.35:

PSI TYPE PISTON SEAL

Description

The PSI seal type shows a double effect profile on the dynamic face due to the symmetrical shape. The internal groove that houses the O-Ring also has axial notches to help energize the seal and ensures perfect sealing performance at both low and high pressure. Radial notches on the side ensure an anti-bonding and venting effect.

Technical data

Pressure: < 350 bar
 Speed: < 1 m/s
 Temperature: from - 35° C to + 100° C, with peaks at 110° C
 Fluids: mineral-based fluids

Material

Material proposed is Co: TPU 94 Shore A hardness. O-ring in NBR 70 Shore A (No).
 Compound reference: CN.

Assembling

To prevent any damage to the seal during assembly, remove all swarf and sharp edges within the housing. Ensure a lead-in chamfer in the bore to facilitate the piston installation.

Note: do not use in case of Bright drawn surface machining on bore.

PSZ

TENUTA PISTONE TIPO PSZ

Descrizione

La tenuta PSZ a doppio effetto, per movimenti solo dinamici, è il risultato della combinazione tra un pattino in materiale plastico tagliato a gradino e un anello in materiale elastomerico (NBR) di sezione rettangolare con funzione energizzante.

L'alta resistenza del materiale plastico permette alla tenuta di resistere a pressioni elevate e a giochi radiali (pistone/camicia) di gran lunga superiori alle attuali tenute. Le lavorazioni meccaniche del pistone risultano così semplificate e facilitate. Utilizzata in escavatori, sollevatori, gru e carrelli elevatori.

Limiti d'impiego

Pressione: < 800 bar (con picchi fino a 1000 bar)
 Velocità: < 1 m/s
 Temperatura: da - 30 °C a +110°C
 Fluidi: fluidi e oli a base minerale.
 (v. tabella 3 a p.14)

Materiale

Anello elastomerico in NBR 75 Shore A.
 Pattino in materiale PA66 modificato.

Montaggio

Il montaggio è semplificato grazie al pattino tagliato a gradino.
 Si monta in cava chiusa dopo aver montato l'elemento energizzante in NBR e si consiglia di ingrassare prima di inserire il pistone nel cilindro.

Nota: non utilizzare in applicazioni statiche.

Fig. 36 - Pic.36:

PSZ TYPE PISTON SEAL

Description

The double effect PSZ seal only for dynamic movement, is the result of a combination between plastic runner with step cut and elastomeric Q-ring (NBR) for energizing.

The high strength of the plastic material, grant the sealing effect at high pressure and permit higher radial clearance (Piston/ Bore) compare to other piston seals.

This last aspect allows for an easier machining of the piston.

Fields of applications: excavators, lifts, cranes and fork lifts.

Technical data

Pressure: < 800 bar (with peaks till 1000 bar)
 Speed: < 1 m/s
 Temperature: from - 30° C to + 110° C
 Fluids: mineral-based fluid and oil.
 (see table 3, page 14)

Material

Elastomeric ring in NBR 75 Shore A.
 Plastic Runner in modify PA66 material.

Assembling

The installation is simplified because the Runner has a cutting step.

The assembling in in closed groove after the installation of NBR energizing element.

Grease before the piston installation in the cylinder.

Note: do not use in static applications.

Fig. 37- Pic.37:

PHP

TENUTA PISTONE TIPO PHP

Descrizione

La tenuta pistone PHP è studiata per cilindri a doppio effetto dove le pressioni e le condizioni di lavoro sono molto gravose. È composta da tre elementi:

- parte statica con funzione energizzante
- parte centrale dinamica con funzione di tenuta assiale
- anelli laterali antiestrusione che consentono un gioco radiale maggiore tra pistone e camicia del cilindro.

Utilizzata sui cilindri macchine movimento terra, macchine di sollevamento e presse.

Limiti d'impiego

Pressione: < 400 bar (con materiale TPU)
< 600 bar (con materiale PTFE)

Velocità: < 0.8 m/s (con materiale TPU)
< 1.5 m/s (con materiale PTFE)

Temperatura: da - 35 °C a +100°C (con punte fino a 110°C con materiale TPU)
da -35°C a + 150° (con materiale PTFE)

Fluidi: fluidi e oli a base minerale (v. tabella 3 a p. 14)

Materiale

- anello espansore statico in NBR 80 Shore A
- anello di tenuta dinamica in TPU 93 Shore A (standard per pressioni fino a 300 [bar])
- anello di tenuta dinamica in TPU 98 Shore A (standard per pressioni fino a 400 [bar])
- anello di tenuta dinamica in PTFE (per pressioni fino a 600 [bar] e alte velocità)
- anelli antiestrusione in materiale termoplastico (POM oppure TPE).

Montaggio

Il montaggio può avvenire sia su pistone monoblocco sia su pistone in due parti.

Sequenza del montaggio:

- elemento in gomma
- elemento in poliuretano o in PTFE
- anelli antiestrusione.

Togliere gli spigoli vivi e le bave di lavorazione per evitare di danneggiare la tenuta durante il montaggio.

PHP TYPE PISTON SEAL

Description

The PHP piston seal is design for double effect cylinder where the pressure and working conditions are heavy.

It is composed by three elements:

- static Part that has energizing function
- central Dynamic part has axial sealing function
- lateral antiextrusion Ring allow a greater radial clearance between piston and bore cylinder.

Cylinders used on earth moving machines, lifting machines and presses.

Technical data

Pressure: < 400 bar (With TPU material)
< 600 bar (With PTFE material)

Speed: < 0.8 m/s (With TPU material)
< 1.5 m/s (With PTFE material)

Temperature: from - 35 °C to +100°C (with peaks till 110°C with TPU material)
da -35°C a + 150° (with PTFE material)

Fluids: mineral-based fluid and oil.
(see table 3, page 14)

Material

- static energizing ring in NBR 80 Shore A
- dynamic seal in TPU 93 Shore A (standard for pressure until 300 [bar])
- dynamic seal in TPU 98 Shore A (standard for pressure until 400 [bar])
- dynamic seal in PTFE (for pressure until 600 [bar] e high speed)
- anti-extrusion Ring in thermoplastic material (POM or TPE).

Assembling

The assembling can be on monoblock or two-parts piston.

Assembling sequence:

- NBR element
- polyurethane or PTFE element
- anti-extrusion ring.

Eliminate sharp edges and burrs to avoid damaging the seal during assembly.

KDSA

TENUTA PISTONE COMPATTA TIPO KDSA

Descrizione

La tenuta pistone compatta tipo KDSA è costituita da un elemento centrale in gomma nitrilica che esercita la funzione di tenuta, da due supporti laterali all'elemento in gomma che agiscono da anelli antiestrusione e da due guide esterne che mantengono in guida il pistone nel cilindro.

Dati tecnici

Pressione: da 0 a 400
 Velocità: < 0.5 m/s
 Temperatura: da - 30 °C a +100 °C
 Fluidi: oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

I materiali utilizzati per questa tenuta sono:

- NBR con durezza 70 Shore A \pm 3 per l'elemento centrale
- elastomero termoplastico (TPE) per i supporti laterali
- resina poliacetalica le guide esterne (POM).

Codice materiale standard: CX

Montaggio

Il montaggio di questa tenuta è eseguibile sia in cava chiusa su pistone monoblocco sia in cava aperta su pistone in due pezzi.

L'ordine del montaggio deve essere il seguente:

- elemento in gomma
- supporti
- guide.

È necessario che il pistone non presenti bave di lavorazione meccanica che danneggerebbero l'elemento in gomma durante il montaggio.

KDSA TYPE COMPACT PISTON SEAL

Description

The KDSA compact seal is made of a central unit made of NBR working as a seal, two sides supports, working as anti extrusion ring, and two external guide rings, keeping aligned the piston in the cylinder.

Technical data

Pressure: from 0 to 400
 Speed: < 0.5 m/s
 Temperature: from - 30 °C at +100 °C
 Fluids: Mineral oils
 (see table 3, page 14)

Material

The compounds used to manufacture this seal type are:

- the central units is made of NBR, the hardness is 70 Shore A \pm 3
- the sides support are made of thermoplastic elastomer (TPE)
- the external wear rings are made of polyacetal resin (POM).

Compound reference: CX

Assembling

The assembling of this seal can be carried out in either closed groove in a mono-block piston, or in open groove in a two-parts piston.

The assembling has to be done as follows:

- rubber element
- supports
- wear rings.

The piston must not have machining scores which may damage the rubber unit during the installation.

Material

The compounds used to manufacture this seal type are the following:

- the central units is made of NBR, the hardness is 70 Shore A \pm 3
- the sides support are made of a thermoplastic elastomer (TPE)
- the external wear rings are made of polyacetal resin (POM).

Compound reference: CX

Assembling

The assembling of this seal can be carried out in either closed groove in a mono-block piston, or in open groove in a two-parts piston.

The assembling has to be done as follows:

- rubber element
- supports
- wear rings.

Avoid machining scores on the piston which may damage the rubber unit during the installation.

KDSB/AE

TENUTA PISTONE COMPATTA TIPO KDSB/AE

Descrizione

La tenuta pistone compatta tipo KDSB/AE è costituita da un elemento centrale in gomma nitrilica che esercita la funzione di tenuta, da due supporti laterali all'elemento in gomma, e da due anelli antiestrusione.

Diversamente dalla KDSB il pistone nel cilindro deve essere progettato prevedendo gli elementi di guida.

Dati tecnici

Pressione: da 0 a 400
 Velocità: < 0.5 m/s
 Temperatura: da - 30 °C a +100 °C
 Fluidi: oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

I materiali utilizzati per questa tenuta sono:

- NBR con durezza 70 Shore A \pm 3 per l'elemento centrale
- elastomero termoplastico (TPE) per i supporti laterali
- resina poliacetalica le guide esterne (POM).

Codice materiale standard: CX

Montaggio

Il montaggio può essere eseguito sia in cava chiusa su pistone monoblocco sia in cava aperta su pistone in due pezzi.

L'ordine del montaggio deve essere il seguente:

- elemento in gomma
- supporti
- guide.

È necessario che il pistone non presenti bave di lavorazione meccanica che danneggerebbero l'elemento in gomma durante il montaggio.

KDSB/AE TYPE COMPACT PISTON SEAL

Description

The KDSB/AE compact piston seal combines a central NBR unit working as a pressure seal supported by two side elements and two anti-extrusion rings. The KDSB/AE requires the addition of wear rings housed wither side of the seal.

Technical data

Pressure: from 0 to 400
 Speed: < 0.5 m/s
 Temperature: from - 30 °C at +100 °C
 Fluids: Mineral oils
 (see table 3, page 14)

Material

The compounds used to manufacture this seal type are the following:

- the central units is made of NBR, the hardness is 70 Shore A \pm 3
- the sides support are made of a thermoplastic elastomer (TPE)
- the external wear rings are made of polyacetal resin (POM).

Compound reference: CX

Assembling

The assembling of this seal can be carried out in either closed groove in a mono-block piston, or in open groove in a two-parts piston.

The assembling has to be done as follows:

- rubber element
- supports
- wear rings.

Avoid machining scores on the piston which may damage the rubber unit during the installation.

KDSP

TENUTA PISTONE COMPATTA TIPO KDSP

Descrizione

La guarnizione KDSP nasce per tenuta pistone con sedi intercambiabili ISO 6547.

È composta da soli tre elementi: quello centrale in poliuretano (con funzione di tenuta) e due guide laterali in poliacetalica rinforzata vetro.

Questo sistema permette di eliminare i supporti antiestrusione in quanto l'elemento centrale, grazie al suo alto modulo elastico, ha una durezza superiore alla gomma nitrilica NBR.

L'attrito di primo distacco e in esercizio si mantiene basso per la particolare geometria della guarnizione.

Dati tecnici

Pressione: da 0 a 400

Velocità: 0,8 m/s

Temperatura: da -30° C a +100° C

Fluidi: oli a base minerale
(v. tabella 3 a p. 14)

Materiale

I materiali utilizzati per la guarnizione KDSP sono:

- poliuretano di durezza 93 Shore A Codice materiale tipo Co per l'elemento centrale
- poliacetalica caricata vetro (POM) per gli elementi laterali.

Codice materiale: CX

Montaggio

Il montaggio di questa tenuta può essere eseguito sia in cava chiusa su pistone monoblocco sia in cava aperta su pistone in due pezzi. È necessario che il pistone non presenti bave di lavorazione meccanica che danneggerebbero l'elemento di tenuta durante il montaggio.

KDSP TYPE COMPACT PISTON SEAL

Description

The KDSP seal is designed to be a piston seal with interchangeable seats ISO 6547.

It consists of only three elements: a polyurethane seal at the middle and two side wear rings in glass-filled polyacetal resin.

This system doesn't need anti-extrusion supports, Thanks to the high modulus of elasticity and the hardness of the central element, which has higher hardness than Nitrile rubber NBR.

The friction (first operation and in working condition) is low thanks to the particular geometric shape of the seal.

Technical data

Pressure: from 0 to 400 Bar

Speed: 0.8 m/s

Temperature: from -30° C to +100° C

Fluids: mineral oils
(see table 3, page 14)

Material

The materials used for the construction of this type of seal are:

- polyurethane for the central element, hardness 93 Shore A, compound reference Co
- glass-filled polyacetal resin (POM) for the side elements.

Compound reference: CX

Assembling

This seal can be assembled both in closed groove on a mono-block piston and in open groove on a two-part piston.

Avoid machining scores on the piston which may damage the sealing during the installation.

KDAE

TENUTA PISTONE COMPATTA TIPO KDAE

Descrizione

La tenuta pistone compatta KDAE nasce con un elemento centrale in poliuretano ad alto modulo elastico e due anelli antiestrusione laterali in elastomero con elevata durezza. Grazie alla combinazione dei due materiali, la tenuta rimane molto stabile anche alle alte pressioni. L'abrasione, con l'utilizzo del poliuretano, risulta di gran lunga inferiore a quella della gomma e accresce la durata del pistone stesso. L'attrito di primo distacco e in esercizio, grazie allo speciale profilo geometrico della tenuta, è più performante rispetto alla guarnizione in NBR.

Dati tecnici

Pressione: da 0 a 400 bar
 Velocità: < 0,8 m/s
 Temperatura: da -30° C a +100° C
 con punte fino a 110° C
 Fluidi: oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiali utilizzati per la costruzione di questa tenuta sono:

- poliuretano di durezza 93 Shore A. Codice materiale tipo Co per l'elemento centrale
- poliacetalica caricata vetro (POM) per gli anelli antiestrusione laterali.

Codice materiale: CR

Montaggio

Il montaggio di questa tenuta è eseguibile sia in cava chiusa su pistone monoblocco sia in cava aperta su pistone in due pezzi (consigliato da Artic Seals). È importante che il pistone non presenti bave di lavorazione meccanica che danneggerebbero la tenuta durante il montaggio. È inoltre consigliato ingrassare il pistone per facilitare il montaggio.

KDAE TYPE COMPACT PISTON SEAL

Description

The KDAE compact piston seal series type is designed with a central polyurethane element and two side anti extrusion rings.

The assembling between the polyurethane element with high elastic modulus and the two elastomer rings with high hardness enhances stability of the sealing even at heavy duty applications.

Compared to rubber, the abrasion is also reduced due to the use of polyurethane, therefore extending the life of the seal.

The friction (first operation and in working condition) is also considerably reduced, due to geometric shape of the seal, having better performance than NBR.

Technical data

Pressure: from 0 to 400 bar
 Speed: < 0.8 m/s
 Temperature: from -30° C to +100 ° C with peaks
 up to +110° C
 Fluids: mineral oils
 (see table 3, page 14)

Material

The materials used for the construction of this type of seal are:

- polyurethane for the central element, hardness 93 Shore A (Co)
- glass-filled polyacetal resin (POM) for the antiextrusion rings.

Compound reference: CR

Assembling

This seal can be assembled both in closed groove on a mono-block piston and (Artic Seals suggestion) in open groove on a two-part piston.

Avoid machining scores on the piston which may damage the sealing during the installation.

The use of grease in the piston is recommended for easier assembling.

Anelli guida

Wear rings

Materialie

In funzione delle specifiche esigenze determinate dal carico radiale del cilindro sono utilizzabili i seguenti materiali:

- resina poliacetalica (POM) vergine o rinforzata con fibra di vetro a basso coefficiente di attrito
- nylon (PA6 o PA66) caricato con varie tipologie di additivi tra cui vetro, PTFE e MoS₂
- polibutilentereftelato (PBT) caricato PTFE con proprietà autolubrificanti
- PTFE caricato bronzo (TM o TV) resistente all'usura e con basso attrito per applicazioni di basso-medio carico
- tessuto rinforzato con resina fenolica (FR) per sopportare elevati carichi radiali.

Material

The choice of the material depends on the specific needs arising from the cylinder radial load:

- polyacetal resin (POM) reinforced with fibreglass with low friction factor
- nylon (PA6 or PA66) different filled with: Glass, PTFE or MoS₂
- polibutilentereftelato (PBT) filled with PTFE, self-lubricating properties
- PTFE with bronze (TM or TV), wear resistant, low friction, for low and medium load
- fabrics reinforced phenolic (FR) resin, for high radial loads.

Tab.35 Dati Tecnici / Technical Data

Material	Velocità / Speed	Temperatura / Temperature	Carico Radiale / Radial Load	
	m/s	°C	N/ mm ²	T°
POM	<0,8	-40 to +115	<35 <25	<60 °C >60 °C
PA6 / PA66	<1,0	-40 to +140	<75 <40	<60 °C >60 °C
PBT	<1,0	-40 to +150	<35 <25	<60 °C >60 °C
PTFE	<15	-50 to +160 (200)	<15 <12 <8	30°C 80°C 120°C
Phenolic Resin	<1	-50 + 150	<120 <60	25°C 80°C

Dimensionamento

Utilizzando la seguente formula si possono calcolare le altezze delle guide come illustrato in fig.1

$$\text{Altezza Guida } T = \frac{C * f}{D * Cr}$$

Dove:

- C: carico radiale previsto in N [Newton]
- f: fattore di sicurezza [2]
- D: diametro stelo o camicia
- Cr: carico radiale ammissibile in N/mm² riferito al materiale.

Dimensioning

The following formula can be used to calculate the wear ring's height as shown in Pic.1

$$\text{Wear ring's height } T = \frac{C * f}{D * Cr}$$

As:

- C: radial load in N [Newton]
- f: safety factor [2]
- D: rod or bore diameter
- Cr: allowable radial load in N/mm reported material.

Fig.39: distribuzione del carico
Pic.39: load distribution

HIS

ANELLI GUIDA INTERNO TIPO HIS

Descrizione

I pattini di guida tipo HIS hanno la funzione di mantenere in asse tutto il sistema cilindro (stelo con testata e pistone con camicia) e svolgono due importanti compiti: aiutano la tenuta stelo, il raschiatore e la tenuta pistone a lavorare senza disallineamenti ed evitano il contatto tra le parti metalliche.

Il materiale, con un coefficiente di attrito molto basso, non crea perdite di carico (linearità) e sopporta deformazioni elevate sotto carico grazie al punto di rammollimento vicino al punto di fusione (lavora in esercizio a 115° C). Per facilitare la scelta della guida pistone o stelo e conoscerne l'altezza più idonea consigliamo la formula a p.139.

Dati tecnici

Velocità: < 0,8 m/s
 Temperatura: da - 40° C a + 115° C
 Fluidi: oli e fluidi a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale è una resina poliacetalica rinforzata con fibra di vetro.

Per temperature di esercizio superiori ai 115° C il materiale è una resina poliammidica rinforzata.

Codice materiale per temp < 115° C: Ro
 Codice materiale per temp > 115° C: R1

Montaggio

La guida tagliata e l'ottima elasticità semplificano il montaggio, mentre la presenza di smussi sui due lati facilita l'inserimento dello stelo.

Nota: sezione tecnica guide p.158

HIS TYPE INTERNAL WEAR RING

Description

The HIS wear rings have been developed in order to keep all the parts of the cylinder aligned (the rod with the head, the piston with the bore).

They play an important role as they help the rod seal, the wiper and the piston seal working without any misalignments and at the same time they prevent any contact between the metal parts. The material, which has a very low friction factor, does not cause load losses (linearity).

It endures deformations under heavy loads, as the softening point is close to the fusion point (it works at 115° C). For an easier choice of the piston or rod guide, we suggest the use of the formula at page 139 to find the wear ring length.

Technical data

Speed: < 0,8 m/s
 Temperature: from - 40° C to + 115° C
 Fluids: mineral oils and fluids
 (see table 3, page 14)

Material

The material is a polyacetal resin reinforced with fibreglass.

For working temperatures higher than 115° C, the material is a reinforced polyamide resin.

Compound reference for temp < 115° C: Ro
 Compound reference for temp > 115° C: R1

Assembling

The assembling can be easily done since the wear ring is cut and extremely elastic.

The chamfers on both sides have been studied to better insert the wear ring in the rod.

Note: wear rings technical section p.158

HES

ANELLI GUIDA ESTERNO TIPO HES

Descrizione

I pattini di guida tipo HES hanno la funzione di mantenere in asse tutto il sistema cilindro (stelo con testata e pistone con camicia) e svolgono due importanti compiti: aiutano la tenuta stelo, il raschiatore e la tenuta pistone a lavorare senza disallineamenti ed evitano il contatto tra le parti metalliche. Il materiale, con un coefficiente di attrito molto basso, non crea perdite di carico (linearità) e sopporta deformazioni elevate sotto carico grazie al punto di rammollimento vicino al punto di fusione (lavora in esercizio a 115° C). Per facilitare la scelta della guida pistone o stelo e conoscerne l'altezza più idonea consigliamo la formula a p.139.

Dati tecnici

Velocità: < 0,8 m/s
 Temperatura: da - 40° C a + 115° C
 Fluidi: oli e fluidi a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale è una resina poliacetalica rinforzata con fibra di vetro. Per temperature di esercizio superiori ai 115° C il materiale è una resina poliammidica rinforzata. Codice materiale per temp < 115°C: Ro
 Codice materiale per temp > 115°C: R1

Montaggio

La guida tagliata e l'ottima elasticità semplificano il montaggio, mentre la presenza di smussi sui due lati facilita l'inserimento del pistone.

Nota: sezione tecnica guide p.158

HES TYPE EXTERNAL WEAR RING

Description

The HES wear rings have been developed in order to keep all the parts of the cylinder aligned (the rod with the head, the piston with the bore). They play an important role as they help the rod seal, the wiper and the piston seal working without any misalignments and at the same time they prevent any contact between the metal parts. The material, which has a very low friction factor, does not cause load losses (linearity). It endures deformations under heavy loads, as the softening point is close to the fusion point (it works at 115° C). For an easier choice of the piston or rod guide, we suggest the use of the formula at page 139 to find the wear ring length.

Technical data

Speed: < 0,8 m/s
 Temperature: from - 40° C to + 115° C
 Fluids: mineral oils and fluids
 (see table 3, page 14)

Material

The material is a polyacetalic resin reinforced with fibreglass. For working temperatures higher than 115° C, the material is a reinforced polyamide resin. Compound reference for temp < 115°C: Ro
 Compound reference for temp > 115°C: R1

Assembling

The assembling can be easily done since the wear ring is cut and extremely elastic. The chamfers on both sides have been studied to better insert the wear ring in the rod.

Note: wear rings technical section p.158

NG

NASTRO GUIDA IN PTFE TIPO NG

Descrizione

Il nastro guida NG in politetrafluoroetilene caricato bronzo è fornito in rotoli dai quali si ricavano guide intercambiabili con quelle in materiale termoplastico. Le guide sono progettate sia per stelo sia per pistone e hanno come caratteristiche principali la precisione dello spessore e la quasi assenza di attrito. Per la loro inerzia chimica sono compatibili con molti fluidi. Possono essere con o senza smussi di invito.

Dati Tecnici

Velocità: < 15 m/s

Temperatura: da -50°C a +160°C con punte a 200°C

Fluidi: molti fluidi essendo un materiale con inerzia chimica elevata
(v. tabella 3 a p. 14)

Materiale

Il materiale è politetrafluoroetilene (PTFE) con cariche interne di bronzo.

Codice materiale:

TV LBR4030 (verde)

TM LBR4003 (grigio/ marrone)

Montaggio

La guida tagliata e l'ottima elasticità semplificano il montaggio.

Nota: sezione tecnica guide p.158

NG TYPE PTFE WEAR TAPE

Description

NG bronze filled PTFE tape is supplied in rolls.

By cutting them is possible to obtain interchangeable guides to replace thermoplastic material.

They can be used for rods or pistons.

Thanks to the properties (thickness accuracy, low friction and chemical resistance) are compatible with many fluids.

They can be with or without chamfers.

Technical Data

Speed: < 15 m/s

Temperature: from -50°C to +160°C peaks till 200°C.

Fluidi: many fluids as a material with high chemical inertia
(see table 3, page 14)

Material

The material is bronze filled PTFE.

Compound reference:

TV LBR4030 (green)

TM LBR4003 (dark brown)

Assembling

The assembling can be easily done since the wear ring is cut.

Note: wear rings technical section p.158

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

HPW

GUIDA TIPO HPW

Descrizione

Le HPW sono guide in resina fenolica e sono intercambiabili con quelle in materiale termoplastico.

Progettate per stelo e pistone sono ricavate da un tubo per tornitura, lavorazione che garantisce un'alta precisione di spessore. Utilizzate in impieghi decisamente gravosi, sopportano carichi molto elevati.

Dati Tecnici

Velocità: < 1 m/s
 Temperatura: da - 50° C a + 150° C
 Fluidi: oli idraulici a base minerale
 (v. tabella 3 a p. 14)

Materiale

I materiali utilizzabili sono:

- resina fenolica impregnata in trecce di cotone naturale impiegata per carichi medio/bassi
Codice materiale: S0
- resina fenolica impregnata in trecce di poliestere additivata con PTFE.
Codice materiale: S1
- resina fenolica impregnata in trecce di poliestere additivata con grafite
Codice materiale: S3

Montaggio

La guida tagliata e l'ottima elasticità semplificano il montaggio, mentre la presenza di smussi sui due lati facilita l'inserimento dello stelo o del pistone.

Nota: sezione tecnica guide p.158

HPW TYPE WEAR RING

Description

HPW phenolic resin guides can be interchangeable with other thermoplastic wear rings. They can be used for rods or pistons. They are produced from tubes with high thickness accuracy, supporting very high loads and are used in very heavy conditions.

Technical Data

Speed: < 1 m/s
 Temperature: from - 50° C a + 150° C
 Fluids: hydraulic mineral oil
 (see table 3, page 14)

Material

The materials used could be :

- *impregnated phenolic resin in natural cotton braids for low/medium load
Compound reference: S0*
- *impregnated phenolic resin with polyester braids filled PTFE.
Compound reference: S1*
- *impregnated phenolic resin with polyester braids filled graphite
Compound: S3*

Assembling

The assembling can be easily done since the wear ring is cut and extremely elastic. The chamfers on both sides have been studied to better insert the wear ring in the rod or piston.

Note: wear rings technical section p.158

HEN

GUIDA TIPO HEN

Descrizione

Le HEN sono guide studiate per i cilindri tuffanti, in alternativa alle tradizionali boccole in bronzo. Duplice la loro funzione: mantenere in guida lo stelo sulla camicia e fungere da finecorsa. Il passaggio dell'olio è garantito dalle grandi scanalature presenti sul diametro esterno.

Dati Tecnici

Velocità: < 0,8 m/s
 Temperatura: da - 40° C a + 115° C
 Fluidi: oli idraulici a base minerale
 (v. tabella 3 a p.14)

Materiale

Il materiale è una resina poliacetalica rinforzata con fibra di vetro.
 Per temperature di esercizio superiori ai 115°C il materiale è una resina poliammidica rinforzata.
 Codice materiale per temp. <115°C:Ro
 Codice materiale per temp >115°C:R1

Montaggio

La guida tagliata e l'ottima elasticità semplificano il montaggio, mentre la presenza di smussi sui due lati facilita l'inserimento dello stelo.

Nota: sezione tecnica guide p.158

HEN TYPE WEAR RING

Description

The HEN wear rings are designed especially for the plunger cylinders, in substitution to the traditional bronze bushings. It has a double function: it keeps the rod in guide on the bore and acts as a limit switch, the oil passage is guaranteed by the large grooves on the external diameter.

Technical Data

Speed: < 0,8 m/s
 Temperature: from - 40° C a + 115° C
 Fluids: hydraulic mineral oil
 (see table 3, page 14)

Material

*The material is a polyacetal resin reinforced with fibreglass.
 For working temperatures higher than 115° C, the material is a reinforced polyamide resin.
 Compound reference for temp < 115°C: Ro
 Compound reference for temp > 115°C: R1*

Assembling

*The assembling can be easily done since the wear ring is cut and extremely elastic.
 The chamfers on both sides have been studied to better insert the wear ring in the rod.*

Note: wear rings technical section p.158

GDR

TENUTA ROTANTE TIPO GDR

Descrizione

La tenuta per movimenti rotativi tipo GDR è una guarnizione simmetrica con due lati di tenuta per giunti girevoli. La simmetria del profilo ha lo scopo di facilitare il montaggio.

Dati tecnici

Pressione: < 350 bar
 Velocità: < 0,3 m/s
 Temperatura: da - 35° C a + 100° C
 Fluidi: oli minerali
 (v. tabella 3 a p. 14)
 Rugosità superficie: dac Ra 0,1 um a Ra 0,4 um

Materiale

Il materiale proposto è il poliuretano tipo Co ad alto modulo elastico, basso compression-set, alta resistenza all'abrasione.
 Ha una durezza di 93 Shore A ± 2.
 Codice materiale: Co

Montaggio

Il montaggio avviene in cava anulare. Per la sua flessibilità, la guarnizione non necessita di utensili di montaggio.
 Eliminare spigoli e bave che possano danneggiare la guarnizione durante l'installazione.

GDR TYPE ROTARY SEAL

Description

The seal for rotary type GDR is a symmetric two-sided seal for swivel joints.
 The symmetry created has the purpose to facilitate the assembly.

Technical data

Pressure: < 350 bar
 Speed: < 0.3 m/s
 Temperature: from - 35° C to + 100° C
 Fluids: mineral oil
 (see table 3, page 14)
 Surface Roughness: from Ra 0,1 um to Ra 0,4 um

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.
 The hardness is 93 Shore A ± 2.
 Compound reference: Co

Assembling

Installation is in the annular groove.
 For its flexibility does not need installation tools.
 Remove burrs and sharp edges that could damage the seal during installation.

WSL

RASCHIATORE STELO TIPO WSL

Descrizione

Il raschiatore tipo WSL presenta due labbri: uno raschiante e molto flessibile nella parte dinamica e uno sporgente, più corto e molto robusto, nella parte statica. Questo profilo speciale, sia dal lato stelo sia dal lato esterno statico, impedisce alle impurità (scorie, acqua e altro) di penetrare, danneggiare la guarnizione di tenuta e corrodere l'interno del cilindro.

Dati tecnici

Velocità: < 0,8 m/s

Temperatura: da - 35° C a + 100 ° C con punte fino a 110° C.

Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale (v. tabella 3 a p. 14)

Materiale

I materiali utilizzati sono dei poliuretani resistenti all'abrasione e agli agenti atmosferici, con alto modulo elastico. Il materiale standard è di durezza 93 Shore A ± 2. In alternativa, e previo consulto con il nostro ufficio tecnico, sono utilizzabili poliuretani di durezza superiore, come nel caso di condizioni gravose in ambienti molto inquinanti.

Codice materiale: Co

Montaggio

Il montaggio è privo di problemi particolari grazie alla sede semiaperta collocata nella parte più vicina all'esterno del cilindro. Per evitare di incidere il raschiatore durante il montaggio è importante eliminare gli spigoli taglienti e le bave. Per ulteriori informazioni leggere le istruzioni a p. 63.

WSL TYPE ROD WIPER

Description

The WSL wiper has a high flexible wiping lip on the dynamic side and a strong, shorter, protruding lip on the static side.

This special profile keeps the rod and the static side where it is housed free from any impurity, waste or water.

Impurities would damage the seal and corrode the inner part of the cylinder.

Technical data

Speed: < 0.8 m/s

Temperature: from - 35° C to + 100 ° C with peaks till 110° C.

Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils (see table 3, page 14)

Material

The material used is a polyurethane with a high modulus of elasticity, low compression set and high wear resistance.

Its hardness is 93 Shore A ± 2.

Compound reference: Co

Assembling

It is not very problematic as it can be done in semi-open groove located in the nearest part outside the cylinder.

Remove cutting edges and flashes to avoid the scratching of the wiper during the installation.

For further information please refer to the installation instructions on page 63.

R06

RASCHIATORE STELO TIPO R06

Descrizione

Gli anelli raschiatori della serie Ro6 sono utilizzati per impedire l'ingresso di impurità all'interno di apparecchiature oleodinamiche e proteggere le guarnizioni e le parti metalliche che altrimenti potrebbero danneggiarsi.

Dati tecnici

Velocità: < 0,8 m/s
 Temperatura: da -30° C a +100 ° C con punte fino a 110° C.
 Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale standard utilizzato è NBR 90 ShoreA. Per le temperature elevate (da -15°C a +200°C) si consiglia l'utilizzo di FPM 90 Shore A.

Montaggio

Privo di particolari problemi grazie alla sede semiaperta collocata nella parte più vicina all'esterno del cilindro.
 Per evitare di incidere il raschiatore durante il montaggio si raccomanda di eliminare gli spigoli taglienti e le bave.
 Per ulteriori informazioni leggere le istruzioni a p. 63.

R06 TYPE ROD WIPER

Description

The wiper rings of the series Ro6 are used to prevent the entry of impurities inside of hydraulic equipment, thus protecting both the seals and the metal parts that might otherwise be damaged.

Technical data

Speed: < 0.8 m/s
 Temperature: from -30° C to +100 ° C with peaks till 110° C.
 Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
 (see table 3, page 14)

Material

the standard material used is NBR 90 ShoreA. For high temperatures (from -15 ° C to +200 ° C), we recommend the use of FPM 90 Shore A.

Assembling

It is not very problematic as it can be done in semi-open groove located in the nearest part outside the cylinder.
 Remove cutting edges and flashes to avoid the scratching of the wiper during the installation.
 For further information please refer to the installation instructions on page 63.

WSG

RASCHIATORE CON GABBIA METALLICA WSG

Descrizione

Composto da un'anima metallica incollata a un elemento in poliuretano, il raschiatore tipo WSG ha la funzione di pulire lo stelo al suo rientro e mantenere le impurità all'esterno del cilindro. La cava aperta facilita l'esecuzione della sede.

Dati tecnici

Velocità: < 0,8 m/s
 Temperatura: da - 35° C a + 100 ° C con punte fino a 110° C.
 Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale del raschiatore è un poliuretano di durezza 93 Shore A e anima in acciaio.
 Codice materiale: CA

Montaggio

Il montaggio avviene in cava aperta.
 Togliere gli spigoli vivi e le bave per facilitarne l'inserimento.

Attenzione: La cava dove alloggia il raschiatore deve essere in tolleranza di lavorazione come indicato nella tabella. Il mancato rispetto della misura della tolleranza può causare la fuoriuscita del raschiatore durante il movimento.

WSG TYPE WIPER WITH METAL CAGE

Description

The function of the WSG wiper is to clean the rod while returning to position, blocking external impurities.

It is made up of a metal core bonded to a polyurethane element.

The groove is open and allows easier design of the seat.

Technical data

Speed: < 0.8 m/s
 Temperature: from - 35° C to + 100 ° C with peaks till 110° C.
 Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
 (see table 3, page 14)

Material

The material of the wiper is a polyurethane with a hardness of 93 Shore A and steel core.
 Compound reference: CA

Assembling

The assembling is done in open groove.
 Remove flashes and cutting edges to allow better installation of the wiper.

**Warning: The housing of the wiper must be within the machining tolerance as shown in the table.
 Not observed tolerances may cause the expulsion of the wiper during the operations.**

IWP

RASCHIATORE CON GABBIA METALLICA TIPO IWP

Descrizione

Il raschiatore tipo IWP ha la funzione di mantenere pulito lo stelo al rientro nel cilindro. È composto da un inserto metallico incollato a un elemento in poliuretano e ha largo impiego sulle macchine agricole e movimento terra.

Per il limitato ingombro può proteggere snodi, cuscinetti e boccole di rotolamento (pin dust seal). La cava aperta ne facilita il montaggio.

Dati tecnici

Velocità: < 0,8 m/s

Temperatura: da - 35° C a + 100 ° C con punte fino a 110° C.

Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
(v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato per il raschiatore è un poliuretano a 93° Shore A. La gabbia metallica è realizzata in acciaio.

Codice Materiale: CA

NORME DIN 1624

Montaggio

Il montaggio è in cava aperta e avviene per interferenza (piantaggio). Togliere gli spigoli vivi ed eseguire lo smusso di invito come da tabella allegata per facilitare il montaggio e non danneggiare la gabbia durante l'inserimento.

Attenzione: La cava dove alloggia il raschiatore deve essere in tolleranza di lavorazione come indicato nella tabella. Il mancato rispetto della misura della tolleranza può causare la fuoriuscita del raschiatore durante il movimento.

IWP TYPE WIPER WITH METAL CAGE

Description

The function of the IWP wiper is cleaning the rod while return into position, blocking external impurities. It is made up of an external metal cage core part glued to a PU element. It has widely used on earth moving machinery and agricultural machinery. For the limited size can be used to protect joints, bearings and bushings rolling (pin dust seal). The groove is open and makes easier the design of the seat.

Technical data

Speed: < 0.8 m/s

Temperature: from - 35° C to + 100 ° C with peaks till 110° C.

Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
(see table 3, page 14)

Material

The material of the wiper is a polyurethane with a hardness of 93° Shore A and steel core.

Compound reference: CA

NORMS DIN 1624

Assembling

The assembling is done in open groove (interference). Remove flashes and cutting edges to allow better installation of the wiper to facilitate and not damage the cage during insertion.

Warning: The housing of the wiper must be within the machining tolerance as shown in the table.

Not observed tolerances may cause the expulsion of the wiper during the operations.

DWP

RASCHIATORE BIDIREZIONALE CON GABBIA METALLICA TIPO DWP

Descrizione

Il raschiatore DWP è di tipo bidirezionale con gabbia metallica. Dotato di funzione raschiante sullo stelo, questo raschiatore presenta un labbro di tenuta che lavora in tandem con la guarnizione primaria. È utilizzato in cilindri di macchine movimento terra dove l'effetto raschiante è molto importante poiché si lavora a contatto con materiali come terra, cemento e ghiaccio.

Dati tecnici

Velocità: < 0,8 m/s
 Temperatura: da - 35° C a + 100 ° C con punte fino a 110° C.
 Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato per il raschiatore è un poliuretano a 93° Shore A. La gabbia metallica è realizzata in acciaio.
 Codice Materiale: CA
 NORME DIN 1624

Montaggio

Il montaggio è in cava aperta e avviene per interferenza (piantaggio). Togliere gli spigoli vivi ed eseguire lo smusso di invito come da tabella allegata per facilitare il montaggio e non danneggiare la gabbia durante l'inserimento.

Attenzione: La cava dove alloggia il raschiatore deve essere in tolleranza di lavorazione come indicato nella tabella. Il mancato rispetto della misura della tolleranza può causare la fuoriuscita del raschiatore durante il movimento.

DWP TYPE BIDIRECTIONAL WIPER WITH METAL CAGE

Description

The DWP wiper is a bi-directional type with metal cage. Besides the function wiper on the stem has a sealing lip that works in tandem with the primary seal. This type of bi-directional scraper is used in cylinders of earth-moving machines where the effect is very important when the wiper is in contact with earth, concrete, ice etc..

Technical data

Speed: < 0.8 m/s
 Temperature: from - 35° C to + 100 ° C with peaks till 110° C.
 Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
 (see table 3, page 14)

Material

The material of the wiper is a polyurethane with a hardness of 93° Shore A and steel core.
 Compound reference: CA
 NORMS DIN 1624

Assembling

The assembling is done in open groove (interference). Remove flashes and cutting edges to allow better installation of the wiper to facilitate and not damage the cage during insertion.

Warning: The housing of the wiper must be within the machining tolerance as shown in the table. Not observed tolerances may cause the expulsion of the wiper during the operations.

R09

RASCHIATORE CON GABBIA METALLICA TIPO R09

Descrizione

Il raschiatore R09 ha la funzione di pulire lo stelo al suo rientro e mantenere le impurità all'esterno. È composto da un'anima metallica rettificata all'esterno e incollata a un elemento raschiante in NBR. La cava che alloggia il raschiatore è aperta e ne facilita il montaggio.

Dati tecnici

Velocità: < 0,8 m/s
 Temperatura: da - 30° C a + 100 ° C con punte fino a 110° C.
 Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale del raschiatore è in gomma nitrilica NBR 90 Shore A e anima in acciaio AISI 1010
 Codice materiale standard: NG

Montaggio

Il montaggio avviene in cava aperta. Togliere gli spigoli vivi e le bave per facilitare l'inserimento.

Attenzione: La cava dove alloggia il raschiatore deve essere in tolleranza di lavorazione come indicato nella tabella. Il mancato rispetto della misura della tolleranza può causare la fuoriuscita del raschiatore durante il movimento.

R09 TYPE WIPER WITH METAL CAGE

Description

The function of the R09 wiper is cleaning the rod while return into position, blocking external impurities. It is made up of an external, ground metal cage core part glued to a NBR element. The groove is open and makes easier the design of the seat.

Technical data

Speed: < 0.8 m/s
 Temperature: from - 30° C to + 100 ° C with peaks till 110° C.
 Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
 (see table 3, page 14)

Material

The wiper material is a nitrile rubber NBR 90 Shore A with steel core AISI 1010.
 Compound reference: NG

Assembling

The assembling is done in open groove. Remove flashes and cutting edges to allow better installation of the wiper.

Warning: The housing of the wiper must be within the machining tolerance as shown in the table. Not observed tolerances may cause the expulsion of the wiper during the operations.

WWS

RASCHIATORE CON STEP TIPO WWS

Descrizione

A differenza di altri profili, il raschiatore tipo WWS è agganciato alla sede tramite un gradino sul lato statico. Questa struttura facilita il montaggio in automatico del particolare e semplifica l'esecuzione meccanica della sede.

I notches della base interna fungono da stabilizzatori e assicurano uno sfiato alla pressione che potrebbe crearsi per via di perdite tra guarnizione e raschiatore con conseguente espulsione di quest'ultimo dalla sede.

Dati tecnici

Velocità: < 0,8 m/s

Temperatura: da - 35° C a + 100 ° C con punte fino a 110° C.

Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
(v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato è un poliuretano molto flessibile (anche a basse temperature) con un'alta resistenza all'abrasione.

Materiale standard poliuretano 90 Shore A (Bo) fino al diametro 35mm.

Per diametri maggiori il poliuretano 93 Shore A (Co).

Codice materiale per diam ≤ 35mm: Bo

Codice materiale per diam > 36mm: Co

Montaggio

La sede semiaperta facilita il montaggio.

Eliminare bave e spigoli taglienti nella sede.

Per ulteriori informazioni leggere le istruzioni a p. 63.

WWS TYPE WIPER WITH STEP

Description

The WWS scraper, unlike other profiles, has a step in the static side which hooks it to the housing.

This helps automated assembling and makes the mechanical construction of the groove extremely easy.

It presents notches in the wiper inner base having stabilisation effect, ensuring good ventilation.

This avoids extrusion problems.

Technical data

Speed: < 0.8 m/s

Temperature: from - 35° C to + 100 ° C with peaks till 110° C.

Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
(see table 3, page 14)

Material

The material used is a very flexible polyurethane, even at low temperatures, with a high abrasion resistance.

Standard polyurethane 90 Shore A up to diameter 35 mm (Bo).

For bigger dimensions standard polyurethane 93 Shore A (Co).

Compound reference diam ≤ 35mm: Bo

Compound reference diam > 36mm: Co

Assembling

The assembling is much easier since it can be done in semi-open groove.

Remove flashes an/or cutting edges in the housing.

For further information please refer to the installation instructions on page 63.

Nota: altre dimensioni non a catalogo a richiesta. Consultare il nostro ufficio tecnico.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

W W N

RASCHIATORE CON STEP TIPO WWN

Descrizione

Il raschiatore tipo WWN può considerarsi una evoluzione del tradizionale WWS.

Le tacche presenti hanno la funzione di scaricare la pressione residua formata tra la guarnizione e il raschiatore evitando l'espulsione di quest'ultimo. Utilizzato principalmente in applicazioni quali molle a gas.

Dati tecnici

Velocità: < 0,8 m/s

Temperatura: da -35° C a +100° C con punte fino a 110° C.

Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale (v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato è un poliuretano molto flessibile (anche a basse temperature) con un'alta resistenza all'abrasione.

Materiale standard poliuretano 90 Shore A (Bo) fino al diametro 35mm.

Per diametri maggiori il poliuretano 93 Shore A (Co).

Codice materiale per diam ≤ 35mm: Bo

Codice materiale per diam > 36mm: Co

Montaggio

La sede semiaperta facilita il montaggio.

Eliminare bave e spigoli taglienti nella sede.

Per ulteriori informazioni leggere le istruzioni a p. 63.

WWN TYPE WIPER WITH STEP

Description

The WWN type wiper is an evolution of the conventional WWS type.

A series of internal venting notches have the function of discharging the residual pressure build up formed between the rod seal and the wiper, thus avoiding the expulsion of the wiper due to pressure. Mainly used in applications such as gas springs.

Technical data

Speed: < 0.8 m/s

Temperature: from -35° C to +100° C with peaks till 110° C.

Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils (see table 3, page 14)

Material

The material used is a very flexible polyurethane, even at low temperatures, with a high abrasion resistance.

Standard polyurethane 90 Shore A up to diameter 35 mm (Bo).

For larger dimensions standard polyurethane 93 Shore A (Co).

Compound reference diam ≤ 35mm: Bo

Compound reference diam > 36mm: Co

Assembling

The assembling is much easier since it can be done in semi-open groove.

Remove flashes an/or cutting edges in the housing.

For further information please refer to the installation instructions on page 63.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

R08

RASCHIATORE CON STEP TIPO R08

Descrizione

Gli anelli raschiatori della serie Ro8 sono utilizzati per impedire l'ingresso di impurità all'interno di apparecchiature oleodinamiche e proteggere guarnizioni e parti metalliche che altrimenti potrebbero essere danneggiate. Rispetto alla serie Ro6, la Ro8 presenta un ulteriore gradino sulla superficie del diametro esterno che blocca, anche radialmente, la parte rigida del raschiatore elevando così le velocità di scorrimento.

Dati tecnici

Velocità: < 0,8 m/s

Temperatura: da -30° C a +100° C con punte fino a 110° C.

Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
(v. tabella 3 a p. 14)

Materiale

Il materiale standard utilizzato è NBR 90 Shore A. Per le elevate temperature (da -15°C a +200°C) si consiglia l'utilizzo di FPM 90 Shore A.

Montaggio

La sede semiaperta facilita il montaggio.
Eliminare bave e spigoli taglienti nella sede.
Per ulteriori informazioni leggere le istruzioni a p. 63.

R08 TYPE WIPER WITH STEP

Description

The Ro8 series of wiper rings are used to prevent the ingress of impurities in hydraulic equipment, thus securing the seals that the metal parts that might otherwise be damaged.

Compared to the type Ro6 presents a further step on the surface of the outer diameter which serves to lock the rigid part of the wiper also radially, thus allowing higher sliding speed.

Technical data

Speed: < 0.8 m/s

Temperature: from -30° C to +100° C with peaks till 110° C.

Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
(see table 3, page 14)

Material

the standard material used is NBR 90 Shore A.
For high temperatures (from -15 ° C to +200 ° C), we recommend the use of FPM 90 Shore A.

Assembling

The assembling is much easier since it can be done in semi-open groove.
Remove flashes an/or cutting edges in the housing.
For further information please refer to the installation instructions on page 63.

WAT

RASCHIATORE ANTI-RIBALTAMENTO TIPO WAT

Descrizione

Dotato di uno speciale profilo, il raschiatore tipo WAT ha la possibilità di autoallinearsi quando lo stelo è soggetto a forti disallineamenti durante l'esercizio. Presenta due labbri che lo rendono simile a una tenuta: il labbro dinamico raschiante più lungo e molto flessibile, il labbro statico più corto che, appoggiandosi sul gradino trattenitore, evita l'entrata delle impurità dall'esterno.

Dati tecnici

Velocità: < 0,8 m/s

Temperatura: da -35°C a $+100^{\circ}\text{C}$ con punte fino a 110°C .

Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60°C , oli a base minerale
(v. tabella 3 a p. 14)

Materiale

I materiali utilizzati sono poliuretani con alto modulo elastico resistenti ad agenti atmosferici e abrasione. Il materiale standard è di durezza 93 Shore A ± 2 . In alternativa, in presenza di condizioni gravose in ambienti molto inquinati, sono utilizzabili poliuretani di durezza superiore. In questo caso consultare il nostro ufficio tecnico.
Codice materiale: Co

Montaggio

La sede semiaperta semplifica il montaggio. Eliminare gli spigoli taglienti e le bave nella sede. Per ulteriori informazioni leggere le istruzioni a p. 63.

WAT TYPE NO-TWISTING WIPER

Description

The WAT wiper can be self-aligned in case of rod misalignment during operations, thanks to its special profile and design. It presents two lips and it's similar to a seal: the scraping lip is longer very flexible and dynamic; the static lip is shorter and stops the impurity sticking to the blocking step.

Technical data

Speed: < 0.8 m/s

Temperature: from -35°C to $+100^{\circ}\text{C}$ with peaks till 110°C .

Fluids: atmospheric factors, water at a temperature below 60°C , mineral oils
(see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance. The hardness is 93 Shore A ± 2 .
Compound reference: Co
It is also possible to use harder polyurethanes for heavy polluted environments.
In case please contact our technical department.

Assembling

The assembling is extremely easy because of the semi-open groove. Remove flashes an/or cutting edges in the housing. For further information please refer to the installation instructions on page 63.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

TRD

ANELLO RASCHIATORE TIPO TRD

Descrizione

I raschiatori tipo TRD sono composti da un elemento in PTFE + o-ring che svolge tenuta nella parte statica e contemporaneamente svolge un effetto energizzante sul raschiatore in assenza di pressione. Il TRD ha un effetto raschiante della parte esterna del cilindro e trattiene il film di olio residuo dal lato interno dello stelo. Con una tenuta adeguata permette di lavorare con ritorno idrodinamico nel cilindro.

Dati tecnici

Velocità: < 15 m/s

Temperatura: da -30°C a + 100° C per il tipo standard con O-Ring in nitrile.

Con punte fino a 120°C per periodi brevi e da -15°C a + 200° C per il tipo con o-ring in FKM.

Materiale

PTFE caricato a bronzo per il tipo standard e o-ring in nitrile.

Codice materiale: TN

Montaggio

Il montaggio è semplificato perché effettuato in cava semiaperta.

- Inserire l'o-ring nella sede
- inserire l'elemento in PTFE
- eliminare gli spigoli vivi e le bave nella sede.

Per ulteriori informazioni leggere le istruzioni a p. 64.

TRD TYPE WIPER RING

Description

The TRD wipers are made of a PTFE element and an O-Ring having a sealing effect in the static part and, at the same time has an energizing effect on wiper in the absence of pressure.

The TRD also has a scraping effect on the outside of the Cylinder and maintains a residual oil film on the internal part of the rod.

Used with proper sealing, allows the hydrodynamic return in the cylinder.

Technical data

Speed: < 15 m/s

Temperature: from - 30° C to + 100° C for the standard type with nitrile O-Ring.

Short peaks till +120° C
from -15°C to +200°C with FKM o-rings

Material

Bronze-filled PTFE for the standard type, and nitrile rubber NBR for the O-Ring.

Compound reference: TN

Assembling

Easy assembling in semi-open groove.

- The O-Rings have to be fitted first into the groove
- then the PTFE element
- remove flashes and/or cutting edges in the groove.

For further information please refer to the installation instructions on page 64.

WED

RASCHIATORE BIDIREZIONALE TIPO WED

Descrizione

Il raschiatore bidirezionale tipo WED presenta il profilo combinato di un raschiatore e una guarnizione con un labbro raschiante nella parte esterna e un labbro di tenuta in quella interna. Ha le dimensioni intercambiabili con le sedi dei raschiatori più utilizzati. Il labbro che agisce come raschiatore è molto flessibile e si adatta ai disallineamenti dello stelo mentre quello sulla parte di tenuta è più robusto e allungato, proprio per garantire la tenuta e portare nel cilindro il film di olio che si crea sullo stelo.

Dati tecnici

Velocità: < 0,8 m/s
 Temperatura: da - 35° C a + 100 ° C con punte fino a 110° C.
 Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

I materiali utilizzati sono poliuretani con alto modulo elastico resistenti all'abrasione e agli agenti atmosferici. Il materiale standard è di durezza 93 Shore A. In alternativa, in presenza di condizioni gravose in ambienti molto inquinati, sono utilizzabili poliuretani di durezza superiore. In questo caso consultare il nostro ufficio tecnico.

Codice materiale: Co

Montaggio

Il montaggio, molto semplice, è in sede semiaperta. Eliminare bave e spigoli taglienti nella sede per non danneggiare la tenuta.
 Per ulteriori informazioni leggere le istruzioni a p. 63.

WED TYPE DOUBLE ACTING WIPER

Description

The WED bidirectional scraper has a combined scraper profile where the seal is provided with a scraping lip on the outside and a sealing lip on the inside.

The dimensions are interchangeable with normal scraper housings.

The scraping lip is very flexible and it compensates misalignments of the rod. The sealing side has a stronger and longer lip to ensure the sealing performance and to help the oil film remaining on the rod to go back into the cylinder.

Technical data

Speed: < 0.8 m/s
 Temperature: from - 35° C to + 100 ° C with peaks till 110° C.
 Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
 (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.

The hardness is 93 Shore A ± 2.

Compound reference: Co

It is also possible to use harder polyurethanes for heavy polluted environments.

In case please contact our technical department.

Assembling

The assembling is extremely easy because of the semi-open groove.

Remove flashes and/or cutting edges in the housing.

For further information please refer to the installation instructions on page 63.

WDA

RASCHIATORE BIDIREZIONALE TIPO WDA

Descrizione

Progettato per essere una efficace seconda guarnizione a bassa pressione, il raschiatore bidirezionale tipo WDA presenta una geometria arrotondata nella parte statica che favorisce lo sfiato di olio in caso di microperdite.

Nella parte esterna, i labbri dinamici presentano un robusto labbro raschiante con piccolo raggio che, a contatto con lo stelo, mantiene le impurità all'esterno. Al tempo stesso facilita il rientro del film di olio evitando che rimanga sullo stelo.

Nella parte interna, il labbro a spigolo vivo lavora in tandem con la guarnizione primaria.

Dati tecnici

Velocità: < 0,8 m/s

Temperatura: da -35°C a $+100^{\circ}\text{C}$ con punte fino a 110°C .

Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60°C , oli a base minerale
(v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato è un poliuretano tipo Co con alto modulo elastico, basso compression-set ed elevata resistenza all'usura. Ha una durezza 93 Sh A ± 2

Codice materiale: Co

Montaggio

Lubrificare il raschiatore prima del montaggio ed eliminare bave di lavorazione della sede e spigoli taglienti per evitare danneggiamenti.

Fig.40-Pic.40:

WDA TYPE DOUBLE ACTING WIPER

Description

The WDA bidirectional wiper has a rounded geometry in the static part to promote the oil venting in the event of micro leakage. It is designed to be an effective secondary seal at low pressure.

The dynamic lips have, on the outer part, a strong wiping lip with a small radius: when in contact with the rod this lip blocks any external impurities. At the same time, it makes the retreat of the oil film easier, preventing it from remaining on the rod. In the inner part the cutting edge lip works in conjunction with the main seal.

Technical data

Speed: < 0.8 m/s

Temperature: from -35°C to $+100^{\circ}\text{C}$ with peaks till 110°C .

Fluids: atmospheric factors, water at a temperature below 60°C , mineral oils
(see table 3, page 14)

Material

The material used is a Co-type polyurethane with high elasticity modulus, low compression-set and high resistance to wear.

The hardness is 93 Sh A ± 2

Compound reference: Co

Assembling

To prevent any damage to the wiper, remove all machining scores on the housing and cutting edges. The wiper should be lubricated before assembly.

Nota: altre dimensioni non a catalogo a richiesta. Consultare il nostro ufficio tecnico.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

WIP

RASCHIATORE TIPO WIP

Descrizione

Il raschiatore tipo WIP si utilizza in condizioni di lavoro gravose, come cilindri per macchine movimento terra, per miniere e dove lo stelo supporta grosse flessioni. Le misure scelte sono per steli in pollici.

Dati tecnici

Velocità: < 0,8 m/s
 Temperatura: da - 40° C a + 90 ° C
 Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

I materiali utilizzati sono poliuretani con alto modulo elastico resistenti all'abrasione e agli agenti atmosferici. Il materiale standard è di durezza 90 Shore A.

In alternativa, in presenza di condizioni gravose in ambienti molto inquinati, sono utilizzabili poliuretani di durezza superiore. In questo caso consultare il nostro ufficio tecnico.

Codice materiale: Bo

Montaggio

Il montaggio, molto semplice, è in sede semiaperta. Eliminare bave e spigoli taglienti nella sede per non danneggiare la tenuta.
 Per ulteriori informazioni leggere le istruzioni a p. 63.

WIP TYPE WIPER

Description

The wiper type WIP applies when the conditions of application can be burden some, type cylinders for earthmoving machinery, mining cylinders, cylinders where the rod supports large deflections.
 The measurement stem from in inch sizes.

Technical data

Speed: < 0.8 m/s
 Temperature: from - 40° C to + 90 ° C
 Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
 (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance.

The hardness is 90 Shore A ± 2.

Compound reference: Bo

It is also possible to use harder polyurethanes for heavy polluted environments.

In case please contact our technical department.

Assembling

The assembling is extremely easy because of the semi-open groove.

Remove flashes an/or cutting edges in the housing.

For further information please refer to the installation instructions on page 63.

W N M

RASCHIATORE TIPO WNM

Descrizione

Il raschiatore tipo WNM è stato creato per applicazioni in cui è necessario eliminare materiali molto aggressivi (calcestruzzo, ghiaccio, cemento) dallo stelo.

Il labbro dinamico, più lungo e flessibile di quello statico, vince i disallineamenti dello stelo.

Dati tecnici

Velocità: < 0,8 m/s

Temperatura: da - 40° C a + 135 ° C con punte fino a 140° C.

Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
(v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato, molto resistente all'abrasione, è un poliammide (PA) con bisolfuro di molibdeno (MoS₂).

Montaggio

Il montaggio avviene per pressione in cava semiaperta.

Si consiglia di ingrassare la sede per facilitare l'inserimento.

Per ulteriori informazioni leggere le istruzioni a p. 63.

WNM TYPE WIPER

Description

The WNM type Wiper has been created for applications where there is the need to eliminate very aggressive materials from the rod, such as concrete, ice, cement etc.

It is designed with the dynamic lip longer than the static one so that it is more flexible to win the misalignment of the rod.

Technical data

Speed: < 0.8 m/s

Temperature: from - 40° C to + 135° C with peaks till 140° C.

Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
(see table 3, page 14)

Material

the material used is a polyamide (PA) with molybdenum disulfide (MoS₂), a material highly resistant to abrasion.

Assembling

The assembly, by pressure occurs in semi open groove.

It is recommended to grease the seat for easy insertion.

For further information please refer to the installation instructions on page 63.

WEL

RASCHIATORE PER ESTERNO TIPO WEL

Descrizione

Il raschiatore tipo WEL è comunemente usato nei cilindri a semplice effetto aperti su un lato. Per evitare che la camicia sia deteriorata da agenti atmosferici, condensa o altro, si utilizza un raschiatore con profilo rovesciato che ha funzione di pulitore.

Dati tecnici

Velocità: < 0,8 m/s
 Temperatura: da - 35° C a + 100 ° C con punte fino a 110° C.
 Fluidi: agenti atmosferici, acqua a temperatura inferiore a 60° C, oli a base minerale
 (v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato è un poliuretano tipo Co ad alto modulo elastico e a basso compression-set, con una elevata resistenza all'usura a 93 Shore A.
 Codice materiale: Co

Montaggio

Il montaggio avviene per accavallamento in sede semiaperta con aggancio, che ha la funzione di impedire l'espulsione del raschiatore durante l'inversione del ciclo. Importante togliere bave e spigoli per evitarne il danneggiamento.
 Per ulteriori informazioni leggere le istruzioni a p. 63.

WEL TYPE EXTERNAL WIPER

Description

The WEL wiper type is commonly used in simple effect cylinders open on one side. Because of its cleaning function, a reverse profile wiper is used to prevent bore wearing which may be caused by atmospheric agents, condensation and other environmental conditions.

Technical data

Speed: < 0.8 m/s
 Temperature: from - 35° C to + 100 ° C with peaks till 110° C.
 Fluids: atmospheric factors, water at a temperature below 60° C, mineral oils
 (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance. The hardness is 93 Shore A ± 2.
 Compound reference: Co

Assembling

The assembling is done by overlapping in semi-open groove with a chamfer preventing the wiper extrusion during the cycle inversion. It is important to remove flashes or cutting edges to avoid damages.
 For further information please refer to the installation instructions on page 63.

Tenute statiche *Static seals*

Tenute Statiche
Static Seals

Tenute statiche

Static seals

A completare il sistema di tenuta di un cilindro oleodinamico, oltre alle guarnizioni dinamiche per stelo e pistone, intervengono le guarnizioni statiche che assicurano la tenuta tra organi reciprocamente fissi.

Le guarnizioni statiche neutralizzano le fughe di fluido attraverso la filettatura esterna della testata e quella necessaria ad avvitare lo stelo al pistone. Esse sono normalmente realizzate con un o-ring in NBR spesso accoppiato a uno o due anelli antiestrusione che divengono necessari in presenza di pressioni elevate e giochi di accoppiamento eccessivi.

Oltre alle limitazioni poste da alte temperature o compatibilità con il fluido, sussiste spesso anche un problema di usura. In presenza di pressioni pulsanti, che comprimono e rilasciano l'o-ring, si genera un effetto che tende a limare l'elemento di tenuta provocando perdite in presenza di superfici di contatto con rugosità non accurata. Sotto questo aspetto risulta estremamente vantaggioso l'impiego di guarnizioni tipo SSA in poliuretano che risolvono il problema, facilitano il montaggio e utilizzano un solo elemento anziché due (o-ring e antiestrusione).

In addition to the already described rod and piston dynamic seals, further components granting the sealing between reciprocating static elements are involved in the hydraulic cylinder sealing system. Static seals prevents leakages of fluid by the head external screw-thread and the thread for tightening the rod to the piston.

The seals are usually composed by a NBR o-ring combined with one or two anti-extrusion rings, necessary in cases of high pressure and excessive coupling clearance.

Besides the limitations resulting from high temperatures or fluid compatibility issues, wear is also a common problem. Pulsating pressures loading or unloading the o-ring, when the roughness of the contact surface does not comply with the specification range, cause "filing" of the sealing part originating a leakage.

The use of a SSA polyurethane seal is more appropriate facing this effect, having also the advantage to have a easier assembling because of one single element instead of two (o-ring and anti-extrusion ring).

SSA

GUARNIZIONE STATICA TIPO SSA

Descrizione

Studiata e collaudata da molti anni, la guarnizione tipo SSA è utilizzata per impieghi statici ma anche dinamici in alcune applicazioni. Impiegata principalmente in sostituzione di un o-ring e di un anello antiestrusione, è costituita da un anello in poliuretano ad alto modulo elastico e a basso compression-set che impedisce l'attorcigliamento durante il montaggio e l'estrusione in esercizio. L'utilizzo di un solo pezzo e il profilo a doppie punte simmetrico facilitano il montaggio all'operatore e dimezzano lo stock di magazzino.

Limiti d'impiego

Pressione: < 400 bar a temperatura di 60° C
 Temperatura: da - 35° C a + 100° C, con punte fino a + 110° C
 Fluidi: olio e grassi minerali, gas non aggressivi (v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato è un poliuretano tipo Co ad alto modulo elastico e a basso compression-set, con una elevata resistenza all'usura a 93 Shore A.
 Codice materiale: Co

Montaggio

È importante eliminare gli spigoli vivi e le bave nella sede ed eseguire uno smusso di invito per facilitare il montaggio.

Nota: in caso di montaggio su testata flottante, si raccomanda di contattare il nostro ufficio tecnico per verificare l'adeguatezza dei giochi di accoppiamento.

SSA TYPE STATIC SEAL

Description

The SSA type static seal has been developed and tested for many years for static and sometimes dynamic sealing applications. It is mainly used as replacement of o-ring and anti-extrusion ring. The use of a high modulus polyurethane with a low compression-set prevents winding during assembling and avoid extrusion in working conditions. One single piece with symmetrical profile allows the operator easier installation reducing at the same time the stock handling.

Technical data

Pressure: < 400 bar at a temperature of 60°C
 Temperature: from - 35° C to + 100° C with peaks till + 110° C
 Fluids: mineral oil and grease, non aggressive gas
 (see table 3, page 14)

Material

The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance. The hardness is 93 Shore A ± 2.
 Compound reference: Co

Assembling

It is important to remove flashes or cutting edges to avoid damages. It's also recommended to make a lead-in chamfer for easier assembling.

Note: for usage in floating head please contact our technical engineer to verify the consistency of the coupling clearance.

VSS

TENUTE PER VALVOLE A CARTUCCIA TIPO VSS

Descrizione

Realizzata in TPU ad alte prestazioni, la tenuta per valvole a cartuccia VSS è utilizzata per applicazioni semi-statiche e semi-dinamiche e consente di ottenere, rispetto ai tradizionali sistemi multicomponente in NBR, vantaggi come:

- migliore resistenza a estrusione e abrasione grazie alle proprietà meccaniche del materiale
- maggior durata della guarnizione nel tempo
- assemblaggio semplificato per effetto del profilo simmetrico
- perfetta intercambiabilità con sedi standard o-ring + anello antiestrusione
- gestione semplificata delle scorte grazie all'utilizzo di un unico componente.

Dati tecnici

Pressione pulsante: 450 [bar] con punte fino a 600 [bar]

Temperatura: da - 35° C a + 100° C, con punte fino a + 110° C

Fluidi: olio e grassi minerali (v. tabella 3 a p. 14)

Montaggio

Il montaggio avviene in modo elastico in sede anulare. È importante eliminare gli spigoli vivi e le bave di lavorazione.

CARTRIDGE VALVES SEAL TYPE VSS

Description

Hydraulic seal for cartridge valves, made in high performance TPU, dedicated to semi-static and semi-dynamic applications.

This one-component seal allows to obtain considerable advantages over conventional multi-component systems in NBR:

- improved extrusion and abrasion resistance thanks to TPU's mechanical properties
- extended seal's life
- easier installation due to symmetrical profile
- perfect interchangeability with standard O-Ring + antiextrusion ring's groove
- cheaper stock handling due to unique component.

Technical data

Impulse pressure: 450 [bar] with peaks until 600 [bar]

Temperature: from - 35° C to + 100° C with peaks till + 110° C

Fluids: mineral oil and grease (see table 3, page 14)

Assembling

The installation is in anular groove and in elastic method. It is important to remove flashes or cutting edges to avoid damages.

Fig.41: Soluzione ARTIC SEALS: unica tenuta in materiale TPU poliestere ad alto modulo elastico, ottimo compression-set e alta resistenza all'abrasione, consente di sostituire i più comuni O-Ring + anello antiestrusione.

Pic.41: ARTIC SEALS solution: unique seals in polyester TPU with high elastic modulus, with an excellent compression set and high abrasion resistance, instead of the more common solution with O-ring + anti-extrusion ring.

Static Seals

FSA

TENUTA PER FLANGE SAE TIPO FSA

Descrizione

In questi anni, la guarnizione tipo FSA (Flange SAE) ha trovato notevole impiego nelle applicazioni statiche in cui un normale o-ring in NBR non resiste a pressione e gioco di accoppiamento elevati. Lo speciale profilo, l'alto modulo elastico e un ottimo compression-set eliminano i problemi di estrusione e perdite nella flangiatura dei tubi.

Limiti d'impiego

Pressione: < 400 bar

Temperatura: da - 35° C a + 100° C, con punte fino a + 110° C

Fluidi: olio e grassi minerali, gas non aggressivi
(v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato è un poliuretano tipo Co ad alto modulo elastico e a basso compression-set, con una elevata resistenza all'usura a 93 Shore A.
Codice materiale: Co

Vantaggi

Ottima resistenza ad abrasione ed estrusione.

Montaggio

È importante eliminare gli spigoli vivi e le bave nella sede ed eseguire uno smusso di invito per facilitare il montaggio che avviene in cava aperta.

FSA TYPE SAE FLANGE SEAL

Description

The FSA seal type (SAE Flange) has recently known a significant development in all static applications where a normal NBR O-ring would not resist to pressure and high coupling clearance. The specific profile and the high modulus of elasticity, together with an excellent compression-set, avoid extrusion and leakage problems in the tube flanging.

Technical data

Pressure: < 400 bar

Temperature: from - 35° C to + 100° C with peaks till + 110° C

Fluids: oil and mineral grease, non-aggressive gases
(see table 3, page 14)

Material

*The proposed material is a "Co" type polyurethane, with high elasticity modulus, low compression-set and high abrasion resistance. The hardness is 93 Shore A ± 2.
Compound reference: Co*

Advantages

Excellent abrasion and extrusion resistance.

Assembling

*It is important to remove flashes or cutting edges in the housing to avoid damages. It's also recommended to make a lead-in chamfer for easier assembling.
The installation in open housing is extremely simple.*

VRA

GUARNIZIONE A V TIPO VRA

Descrizione

La guarnizione tipo VRA è stata studiata per proteggere snodi, cuscinetti, bronzine, flange e tutte le parti meccaniche che lavorano in moto rotatorio o semi rotatorio. Realizzato in materiale Bo a bassa deformazione permanente, questo tipo di profilo impedisce ad acqua, fanghi e altre impurità di penetrare all'interno del componente. La vasta gamma di diametri facilita il costruttore nella scelta dimensionale.

Limiti d'impiego

Pressione: non essendo una guarnizione di tipo tradizionale, la pressione di esercizio è quella necessaria al mantenimento del grasso all'interno del sistema.

Temperatura: da - 40° C a + 90° C

Fluidi: olio e grassi minerali, gas non aggressivi (v. tabella 3 a p. 14)

Materiale

Poliuretano standard a 90 Shore A.

Codice materiale: Bo

Montaggio

È sufficiente ingrassare con grasso minerale le parti metalliche dove va alloggiata la guarnizione.

Eliminare spigoli e bave che danneggerebbero la tenuta.

VRA TYPE V-SEAL

Description

The VRA seal type has been conceived to protect joints, bearings, bronze bushes, flanges and all the mechanical parts in rotation or semi-rotation.

Made of Bo material, having a low permanent deformation, it prevents water mud and other impurities penetration.

The wide range of diameters helps the Manufacturer selection.

Technical data

Pressure: *it is not a traditional seal, the working pressure is therefore the one resulting from keeping the grease within the system.*

Temperature: *from - 40° C to + 90° C*

Fluid: *mineral oil and grease, non-aggressive gas
(see table 3, page 14)*

Material

Standard polyurethane at 90 Shore A.

Compound reference: Bo

Assembling

We recommend to lubricate the metal parts where the seal will be installed with mineral grease.

It is important to remove flashes or cutting edges otherwise they will reduce the sealing performance.

OR e antiestrusione

OR and Backup rings

OR e Antiestrusione

OR and Backup Ring

Descrizione

L'o-ring, di forma toroidale, può essere utilizzato per applicazioni statiche e dinamiche e può essere fornito in varie mescole e durezza. Il campo delle sue applicazioni si è infatti notevolmente ampliato proprio grazie alla reperibilità di varie tipologie di materiali con differenti durezza. Anche se la forma toroidale è stata sostituita da altre tecnicamente più efficaci, la facilità di montaggio, la semplicità di esecuzione della sede e il costo contenuto fanno dell'o-ring la tenuta più utilizzata.

Description

The o-ring presents a toroidal shape and can be used for both static and dynamic applications and can be supplied in different compounds and hardness.

The availability on the market of various types of compounds and hardness has widened the application range.

Even if the toroidal shape has been replaced in some cases by more engineered shapes, the facility in the assembling, the simple groove construction and the limited cost made the O-ring the most used sealing.

O-Rings

Dimensioni, tolleranze e qualità delle sedi

Le tabelle dimensionali indicano la sezione nominale dell'o-ring, il diametro interno e la sede. Le tolleranze di accoppiamento dipendono da pressione di esercizio, temperatura del fluido e durezza dell'elastomero.

Il grafico di fig. 33 indica orientativamente il gioco radiale in funzione di pressione e durezza.

La qualità della sede deve rientrare entro valori che impediscano all'o-ring di usurarsi nel leggero movimento che può avvenire durante cambi di pressioni o durante inversioni di ciclo. Il disegno di fig. 34 elenca le rugosità consigliate delle sedi di pistone e stelo.

Grooves dimensions, tolerance and quality

The o-ring's nominal section, diameter and groove are shown in the dimension charts. The coupling tolerances depend on the working pressure, on the fluid temperature and on the hardness of elastomer. In Fig. 33 is shown the approx. radial gap related to pressure and hardness.

The quality of the groove must remain within certain limits to prevent the o-ring wearing, while possible small movements may occur during pressure variation or cycle inversions.

In Fig. 34 the drawing indicates the suggested roughness for piston and rod grooves.

Fig. 42 - Pic. 42:

Fig. 43 - Pic. 43:

O-Rings

Material

Come indica la descrizione esistono varie mescole e durezza per l'o-ring.

Segue un elenco di alcuni tipi e il relativo utilizzo:

Mescole in NBR di durezza 70 Shore A standard e 90 Shore A su richiesta:

Mescole di impiego generico in oleodinamica e pneumatica.

Hanno una bassa deformazione permanente e resistono molto bene ai fluidi come olio minerale e vegetale, grassi e composti con acqua e glicole con temperatura inferiore a 60° C.

Il range di temperatura in esercizio è compreso tra -30° C e +100° C con punte per periodi brevi fino a 120° C.

Mescole in HNBR di durezza 70 Shore A standard e 75 Shore A su richiesta:

Mescole di base come l'NBR ma con doppio legame del componente butadiene.

Mescola idrogenata utilizzata per impieghi a temperature di 140° C (e per periodi brevi anche a 150° C dove la comune gomma in NBR non resiste), è compatibile con grassi, oli minerali e vegetali e si comporta molto bene all'ossidazione.

Mescole in EPDM di durezza 70 Shore A standard e 75 Shore A, su richiesta:

Mescole impiegate in presenza di acqua, acqua calda, fluido per freni, antigelo e glicoli con un range di temperatura compreso tra -40° C e +150° C.

Mescole in FKM di durezza 70 Shore A standard e 90 Shore A su richiesta:

Mescole in elastomero fluorurato utilizzate in applicazioni con temperature elevate e dove si richiede una inerzia chimica straordinaria. Impiegate a contatto con solventi aromatici, fluidi a base di esteri fosforici, lubrificanti sintetici e acidi concentrati, sono utilizzabili in un range di temperatura compreso tra i -15° C e +200° C.

Mescole in VMQ di durezza di 65/70 Shore A:

Mescole utilizzate nell'industria alimentare e medicale con ottimi risultati in acqua calda, ossigeno e ozono. Il range di temperature da -60° C a +220° C amplia il campo di applicazioni.

La tabella 1 a p. 12 riporta tutte le compatibilità con le mescole disponibili.

Material

There are, as indicated before, different compounds and hardness for O-rings.

Some of the materials and applications are listed hereafter.

NBR 70 Shore A standard compound, NBR90 Shore A on demand:

They can be used for hydraulic and pneumatic applications.

They present low compression-set and they have a very good resistance to fluids like mineral oil, vegetal

oil, greases and water-glycol compounds at temperatures not to exceeding 60° C.

The operating temperature ranges is from -30° C to +100° C, with short peaks up to 120° C.

HNBR 70 Shore A standard compound and HNBR75 Shore A on demand:

As the NBR they're basic compounds but with a double butadiene bond. It is a hydrogenated material and it can be used in applications where the normal rubber does not perform at temperatures of 140° C even with peaks of 150° C.

It is compatible with greases, mineral and vegetable oils has good behaviour against oxidation.

EPDM 70 Shore A standard compound and EPDM 75 Shore A on demand:

They can be used with water, hot water, fluids for brakes circuits, antifreeze fluid, glycols and the temperature range is from -40° C to +150° C.

FKM 75 Shore A standard compounds and FKM90 Shore A on demand:

Fluorinated elastomer compounds for high temperature applications and where high chemical inertia is requested.

They can be used in the contact with aromatic solvents, ester-phosphoric based fluids, synthetic lubricants and concentrated acids with temperature range from -15° C to +200° C.

VMQ 65/70 Shore A compounds:

They're mainly used in the food and medical industry. They give excellent results in hot water, oxygen and ozone.

The wide temperature range (from -60° C to +220° C) allows the use in several application.

For all the compounds compatibilities see table 1, page 12.

O-Ring in poliuretano

Polyurethane O-Rings

O-Ring in poliuretano

Descrizione

Le alte prestazioni dei TPU offrono un'eccellente resistenza all'estrusione, resistenza all'idrolisi, resilienza di rimbalzo molto forte e eccellente resistenza all'olio e all'abrasione. Dedicato per applicazioni statiche e dinamiche e altro in generale, dove gli O-Ring devono essere eseguiti in modo uniforme, anche in condizioni difficili. Questi materiali offrono molte proprietà fisiche eccezionali tra cui:

- Elevata resistenza all'usura
- Set di compressione basso
- Elevata resistenza all'estrusione
- Un ampio intervallo di funzionamento della temperatura

Size Programme

- sezione torica da 2,62 [mm] fino a 10 [mm];
- diametro interno da 10 [mm] fino a 250 [mm].

Condizioni di esercizio

Temperatura:

- da -40°C fino a +90 °C con materiale 90 Shore A
- da -35°C fino a +110 °C con materiale 94 Shore A

Pressione:

- 90 Shore A per pressione fino a 250 [Bar]
- 94 Shore A per pressione fino a 450 [Bar]
con punte fino a 500 [Bar]

Fluidi:

- Grassi e Oli minerali
- Idrocarburi alifatici
- Acqua fino a 50°C
- Grassi e Oli silconici
- Ossigeno, Azoto e ozono
- Fluidi a base glicole fino a 40°C

Polyurethane O-Rings

Description

The high performing of TPUs offer extremely high extrusion resistance, hydrolysis resistance, very strong rebound resilience and excellent oil and abrasion resistance. Dedicated for static and dynamic application and more in general where O-Rings need to perform consistently, even in harsh conditions. These materials offers many outstanding physical properties including:

- High wear resistance
- Low compression set
- High extrusion resistance
- A wide temperature operating range

Size Programme

- cross section from 2,62 [mm] up to 10 [mm];
- inside diameter from 10 [mm] up to 250 [mm].

Working Condition

Temperature:

- from -40°C up to +90 °C material 90 Shore A
- from -35°C up to +110 °C material 94 Shore A

Pressure:

- 90 Shore A for pressure up to 250 [Bar]
- 94 Shore A for pressure up to 450 [Bar]
with peaks up to 500 [Bar]

Material Compatibility

- Mineral Oils and grease
- Aliphatic hydrocarbons
- Water up to 50°C
- Silicone oil and grease
- Oxygen, nitrogen ,ozone
- Glycol based fluids up to 40°C

O-Ring in poliuretano Polyurethane O-Rings

Punto di iniezione

Con lo scopo di ottenere O-Ring universali, che garantiscano perfetta tenuta in applicazioni statiche e dinamiche, sia in tenuta assiale che radiale ARTIC SEALS ha progettato O-Ring con punto di iniezione posizionato a 45° rispetto la sezione torica.

il punto di iniezione può essere come mostrato in figura di seguito:

Fig. 44 - Pic. 44:

**Esterna per diametri:
External for diameter:**

10 [mm] - 150 [mm]

Injection Point

In order to obtain universal O-Rings , which grant a perfect sealing effect both in static and dynamic application which means radial or axial sealing ARTIC SEALS designed O-Ring with 45° injection point position.

the injection point will be as shown here in the picture below:

**Interna per diametri
Internal for diameter:**

150 [mm] - 250 [mm]

Advantages:

Fig. 45 - Pic. 45:

Perfettamente intercambiabile con tutte le dimensioni standard delle sedi sul mercato.

Perfectly interchangeable with all standard O-Ring's dimensions groove available on the market.

O-Ring in TPU evita l'estrusione anche in assenza di anello Backup.

TPU O-Rings avoid the extrusion without any antiextrusion rings.

Installazione e gestione semplificata utilizzando solamente un particolare.

Easier assembly and more efficient stock handling due to use only one item

O-Ring Anti-Rolling®

PATENT PENDING
NO. MI2010A001639

Descrizione

La guarnizione O-ring Anti-Rolling® presenta un innovativo profilo studiato appositamente per superare i limiti tecnici spesso riscontrati nel classico o-ring. Grazie alle protusioni laterali, addossate alla sezione torica centrale, si realizza l'effetto antirotolamento dell'o-ring all'interno della sede e si previene ogni torsione della corda in fase di montaggio e di esercizio.

Inoltre, la sua particolare geometria evita l'utilizzo di anelli antiestrusione garantendo al tempo stesso la totale assenza di estrusione poiché la superficie di tenuta rimane costantemente distante dal fondo della sede.

I notches posizionati sulle protusioni evitano l'incollaggio dell'o-ring alle pareti della sede e fungono da sfiato in caso di residuo di pressione.

Materiali

L'o-ring Anti-Rolling® può essere realizzato in TPU, NBR, FKM e HNBR nelle diverse durezze disponibili. Il nostro ufficio tecnico studia soluzioni adeguate in base alle condizioni di esercizio specifiche dell'applicazione.

Description

The Anti-Rolling® O-Ring is an innovative seal technology designed to avoid the spiral failure mode of the standard O-Rings in radial applications.

The addition of axial protrusions prevents the seal from twisting in the groove during installation and reciprocating movement.

Additionally, the protrusions position the sealing surface away from the damaging effects of the extrusion gap, eliminating the need for separate anti-extrusion (back-up) rings.

The presence of notches, positioned on both protrusions, prevents bonding of O-Ring on the walls of the groove. They also realize ventil-effect in case of residual pressure.

Materiali

The Anti-Rolling® O-Ring could be produced in TPU, NBR, FKM, HNBR in a wide range of grades available. Please contact our technical department to study the appropriate solution according to the specific operating conditions of the application.

Fig.46 - Pic.46:

Perfettamente intercambiabile con la soluzione O-Ring + Anelli antiestrusione permette di utilizzare e tenere a stock un solo particolare.

Fully interchangeable with solution O-Ring+Backup Rings, more efficient stock manage due to use only one item.

La sua particolare geometria garantisce la totale assenza di estrusione in quanto la superficie di tenuta rimane distante dal fondo della sede.

The particular geometry ensures the complete absence of extrusion, because the the protrusions position the sealing surface away from the damaging effects of the extrusion gap.

La protusioni laterali addossate alla sezione torica centrale realizzano l'effetto Anti-Rotolamento, esse prevengono ogni tipo di torsione sia in fase di montaggio sia in fase di esercizio.

The lateral protusion leaned to the central toric section, realize the Anti-Rolling effect, they prevent any twisting both during intallation and exercise.

Anelli antiestrusione

Back-up rings

ANELLI ANTIESTRUSIONE

Descrizione

Come già descritto, la tenuta con o-ring è la più semplice ed economica in condizioni di lavoro non gravose.

In presenza di pressioni più elevate il solo o-ring è insufficiente e bisogna montare o-ring con uno o due anelli antiestrusione per il semplice o doppio effetto realizzati in PTFE, NBR e TPE (termoplastico elastomero).

Dati tecnici

Pressione: <400 bar per il tipo RAE-MAE
<200 bar per il tipo AKN
<300 per i tipi AKC-AKS-AKW

Velocità: <1 m/s

Temperatura: da -20°C a 120°C per i tipi RAE
da -30°C a +100°C per i tipi AKN
da -20°C÷+200°C per i tipi AKC, AKS
e AKW compatibilmente con l'o-ring
montato.

Fluidi: fluidi idraulici a base minerale (v.
tabella 3 a p. 14)

Materiale

I materiali proposti sono:

- TPE (termoplastico elastomero) per il tipo RAEMAE
- NBR 90 Shore A per il tipo AKN
- PTFE per i tipi AKC-AKS-AKW.

Montaggio

Il montaggio avviene in cava chiusa con la sequenza anello antiestrusione e o-ring.

BACK UP RINGS

Description

As described above, the sealing with O-Ring is the simplest and the most economic solution for not heavy working conditions. But when there are high pressures the O-Ring alone is not enough. In this specific case we must mount O-ring with one or two anti-extrusion rings, for the simple or double effect. In the range of anti-extrusion rings there're different materials: PTFE, NBR and TPE (thermoplastic elastomer).

Technical data

Pressure: <400 bar for type RAE-MAE
<200 bar for type AKN
<300 bar for type AKC-AKS-AKW

Speed: < 1 m/s

Temperature: from -20°C to +120°C for type RAE
from -30°C to +100°C for type AKN
from -20°C to +200°C for type
AKC,AKS and AKW
depending on the O-Ring installed

Fluids: mineral hydraulic fluids
(see table 3, page 14)

Material

The different proposed materials are:

- TPE (thermoplastic elastomer) for type RAE-MAE
- NBR 90 Shore A for type AKN
- PTFE for types AKC-AKS-AKW

Assembling

The assembling is done in closed groove fitting the Anti-extrusion-ring before and the O-Ring after.

O-Ring + anello antiestrusione O-Ring + back-up ring

Montaggio Assembling

Avvertenze e precauzioni di montaggio nei sistemi pneumatici

Per un ottimo funzionamento delle guarnizioni occorre evitare tagli e deformazioni permanenti durante il montaggio.

Si raccomanda inoltre di rispettare le norme internazionali ISO per le dimensioni degli alloggiamenti e le tolleranze.

Per le finiture delle superfici e i valori cui attenersi fare riferimento alle figure 37 e 38, mentre per lo smusso d'invito vedere la tabella sotto.

Le finiture di sola rettifica sono sconsigliate e si raccomanda la lucidatura prima del montaggio.

Assembling instructions

For a correct functioning seals it's necessary to avoid cuts or permanent deformations during the assembling process. It's also recommended to follow the ISO norms concerning housings and tolerances. Regarding the surfaces finish, take a look at the following sketches 37 and 38 indicating the values to be respected.

A further polishing operation is usually suggested before mounting, since the only grinding operation isn't recommended.

RSP

TENUTA STELO PER PNEUMATICA TIPO RSP

Descrizione

La tenuta stelo tipo RSP è stata progettata per superare i limiti di guarnizioni analoghe e aumentare scorrevolezza e sensibilità alle basse pressioni. Il labbro dinamico arrotondato favorisce la linearità del movimento mentre la marcata profondità della gola tra il labbro dinamico e quello statico aumenta la flessibilità e migliora l'adattamento a eventuali disallineamenti del sistema.

Limiti d'impiego

Pressione: < 20 bar
 Velocità: < 1 m/s
 Temperatura: da - 40° C a + 90° C
 Fluidi: aria con o senza lubrificazione, oli e grassi minerali (v. tabella 3 a p. 14)

Materiale

Materiale standard poliuretano a 90 Shore A.
 Codice materiale: Bo
 Materiale alternativo poliuretano a 85 Shore A.
 Codice materiale alternativo: Ao

Montaggio

Eliminare tutti gli spigoli vivi e le bave nella sede per facilitare il montaggio e non danneggiare la guarnizione durante l'inserimento.
 Lo stelo deve essere privo di bave e avere uno smusso d'invito.

RSP TYPE ROD SEAL FOR PNEUMATIC

Description

The rod seal type RSP, present technical design characteristics aimed to overcome the existing limits of similar seals on the market, in order to obtain a smoother seal which is also more sensible to low pressure.

A rounded dynamic lip improves linear movements. Deeper U-profile between the dynamic and the static lip improves flexibility and performs better in case of misalignments in the system.

Technical data

Pressure: < 20 bar
 Speed: < 1 m/s
 Temperature: from - 40° C up to + 90° C
 Fluids: air with or without lubrication, mineral oils or grease
 (see table 3, page 14)

Material

Standard polyurethane 90 Shore A.
 Compound reference: Bo
 Alternative polyurethane 85 Shore A.
 Alternative compound reference: Ao

Assembling

It is important to remove flashes or cutting edges in the housing to avoid damages.
 The rod must not have present flashes and must have a lead-in chamfer.

SRS

TENUTA STELO A MOLLA TIPO SRS

Descrizione

La guarnizione tipo SRS è progettata per la tenuta stelo di cilindri pneumatici e per valvole pneumatiche dove gli ingombri lo permettono. Presenta un profilo arrotondato al centro sul labbro dinamico e due sporgenze sul labbro statico. Le ridotte dimensioni delle sedi consentono un'esecuzione di lavorazione macchina semplice. La particolare forma a molla rende il sistema molto scorrevole anche a bassa pressione mentre il profilo simmetrico ne facilita il montaggio.

Limiti d'impiego

Pressione: < 20 bar
 Velocità: < 1 m/s
 Temperatura: da - 40° C a + 90° C
 Fluidi: aria con o senza lubrificazione, oli e grassi minerali (v. tabella 3 a p. 14)

Materiale

Materiale standard poliuretano a 90 Shore A.
 Codice materiale standard: Bo
 Materiale alternativo poliuretano a 85 Shore A.
 Codice materiale alternativo: Ao

Montaggio

Eliminare tutti gli spigoli vivi e le bave per evitare di compromettere la guarnizione.
 Lo stelo deve essere privo di bave e avere uno smusso d'invito.

SRS TYPE SPRING ROD SEAL

Description

The SRS rod seal has been designed for pneumatic cylinder applications. The SRS can also be used for pneumatic valves where the overall dimensions allowed. Moreover a shorter machining of the system can be obtained thanks to the reduced overall dimensions. The profile is rounded in the middle of the dynamic lip and it has two projections on the static lip. This symmetrical shape allows easier installation. The special spring shaped profile ensures high flexibility in the system even at low pressure.

Technical data

Pressure: < 20 bar
 Speed: < 1 m/s
 Temperature: from - 40° C up to + 90° C
 Fluids: air with or without lubrication, mineral oils or grease
 (see table 3, page 14)

Material

Standard polyurethane 90 Shore A.
 Standard compound reference: Bo
 Alternative polyurethane 85 Shore A.
 Alternative compound reference: Ao

Assembling

*It is important to remove flashes or cutting edges in the housing to avoid damages.
 The rod must not have present flashes and must have a lead-in chamfer.*

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

SRS/N

TENUTA STELO A MOLLA TIPO SRS/N

Descrizione

La guarnizione tipo SRS/N è realizzata per tenuta stelo di cilindri pneumatici e per valvole pneumatiche dove gli ingombri lo permettono. Le ridotte dimensioni delle sedi consentono un'esecuzione di lavorazione macchina veloce e semplice. Il profilo simmetrico ne facilita il montaggio mentre la particolare forma a molla rende il sistema molto scorrevole anche a bassissima pressione.

Limiti d'impiego

Pressione: < 12 [bar]
 Velocità: < 1 [m/s]
 Temperatura: -30 °C ÷ +100 °C mescola NBR
 -15 °C ÷ +150 °C mescola FKM
 Fluidi: aria lubrificata, grassi e oli minerali (v. tabella 3 a p. 14)

Materiale

Il materiale standard è NBR 80 Shore A.
 A richiesta materiale FKM 75 Shore A.
 Codice materiale standard: N1

Montaggio

Eliminare spigoli vivi e bave per non danneggiare la tenuta al momento del montaggio.
 Lo stelo deve essere privo di bave e avere uno smusso d'invito.

SRS/N TYPE SPRING ROD SEAL

Description

The seal type SRS / N is a rod seal for pneumatic cylinders.
 The SRS/N can also be used for pneumatic valves where the overall dimensions allowed.
 The reduced dimensions of the seat allows fast and simple machining operations.
 This symmetrical profile allows easier installation.
 The special spring shape ensure a system sliding even at very low pressure.

Technical data

Pressure: < 12 [bar]
 Speed: < 1 [m/s]
 Temperature: -30 °C ÷ +100 °C NBR material
 -15 °C ÷ +150 °C FKM material
 Fluids: Lubricated air, grease and mineral oils (see table 3, page 14)

Material

Standard material is NBR 80 Shore A.
 On demand material FKM 75 Shore A
 Standard compound reference: N1

Assembling

It is important to remove flashes or cutting edges in the housing to avoid damages.
 The rod must not have present flashes and must have a lead-in chamfer.

CSA

GUARNIZIONI AMMORTIZZO TIPO CSA

Descrizione

L'elemento d'ammortizzo tipo CSA è studiato per la frenatura di fine corsa nei pistoni dei cilindri pneumatici.

Queste le caratteristiche che concorrono all'efficacia del sistema frenante della guarnizione CSA:

- il profilo raschiante con lo smusso d'invito che facilita l'inserimento dell'ogiva
- le scanalature all'esterno che permettono l'allineamento
- il bordo alla base dell'ammortizzo
- l'utilizzo del poliuretano che grazie all'alto modulo elastico e all'alta resistenza all'urto garantisce una lunga durata in esercizio.

Limiti d'impiego

Pressione: < 20 bar

Velocità: < 1 m/s

Temperatura: da - 40° C a + 90° C

Fluidi: aria con o senza lubrificazione, oli e grassi minerali (v. tabella 3 a p. 14)

Materiale

Il materiale standard è un poliuretano a basso compression-set con una buona flessibilità a freddo.

Materiale standard poliuretano a 90 Shore A.

Codice materiale standard: Bo

Materiale alternativo, (d > 40) poliuretano a 93 Shore A.

Codice materiale alternativo: Co

Montaggio

Il montaggio avviene in sede semiaperta, pertanto si consiglia di eliminare tutti gli spigoli vivi e le bave per evitare di compromettere la guarnizione.

Lubrificare con grasso per prolungare la durata.

CSA TYPE CUSHIONING SEAL

Description

The CSA cushioning seal is designed for braking points at the end-stroke of pneumatic cylinders.

Several elements contribute to the increased efficiency of the CSA seal braking system:

- the scraping profile with lead-in chamfer for better insertion of the shoulder
- the external grooves granting auto-alignment
- the edge at the bottom of the cushioning
- the use of polyurethane which ensures a long service life thanks to the high modulus of elasticity
- and the very good impact resistance.

Technical data

Pressure: < 20 bar

Speed: < 1 m/s

Temperature: from - 40° C up to + 90° C

Fluids: air with or without lubrication, mineral oils or grease
(see table 3, page 14)

Material

The standard raw material is a low compression-set polyurethane with good flexibility at low temperature.

Standard polyurethane 90 Shore A.

Standard compound reference: Bo

Alternative (d > 40) polyurethane 93 Shore A.

Alternative compound reference: Co

Assembling

The assembling is done in semi-open groove, therefore cutting edges or flashes should be removed otherwise they may influence the sealing performance.

Lubrication with grease will increase lifetime of the seal.

Nota: altre dimensioni non a catalogo a richiesta. Consultare il nostro ufficio tecnico.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

PSP

TENUTA PISTONE PER PNEUMATICA TIPO PSP

Descrizione

La guarnizione tipo PSP è progettata per la tenuta pistone di cilindri pneumatici a semplice e doppio effetto.

La gola molto marcata tra il labbro dinamico e quello statico e la raggiatura dei due labbri di contatto aumentano la scorrevolezza della guarnizione, anche in assenza di lubrificazione.

Le limitate dimensioni e l'alta flessibilità del materiale semplificano il montaggio anche in cava chiusa.

Limiti d'impiego

Pressione: < 20 bar

Velocità: < 1 m/s

Temperatura: da - 40° C a + 90° C

Fluidi: aria con o senza lubrificazione, oli e grassi minerali (v. tabella 3 a p.14)

Materiale

Materiale standard poliuretano a 90 Shore A.

Codice materiale standard: Bo

Materiale alternativo poliuretano a 85 Shore A.

Codice materiale alternativo: Ao

Montaggio

Eliminare tutti gli spigoli vivi e le bave nella sede del pistone per evitare di compromettere la guarnizione.

Eseguire uno smusso sulla camicia del cilindro per facilitare il montaggio.

Si consiglia di lubrificare la guarnizione per rendere il sistema molto scorrevole.

PSP TYPE PISTON SEAL FOR PNEUMATICS

Description

The PSP piston seal has been designed for single and double action pneumatic cylinders.

The deep groove between the dynamic and the static lip, together with back-to-back radius lips, enhance seal sliding, even where there is a lack of environmental lubrication.

The reduced dimensions, together with the high flexibility of the material, also facilitates installation in closed grooves.

Technical data

Pressure: < 20 bar

Speed: < 1 m/s

Temperature: from - 40° C up to + 90° C

Fluids: air with or without lubrication, mineral oils or grease
(see table 3, page 14)

Material

Standard polyurethane 90 Shore A.

Standard compound reference: Bo

Alternative polyurethane 85 Shore A.

Alternative compound reference: Ao

Assembling

It is important to remove flashes or cutting edges in the housing to avoid damages.

The bore must not have flashes and must present a lead-in chamfer.

Lubrication with grease will increase lifetime of the seal.

Remark: please contact our technical dept. for further dimensions not included in the catalogue.

MPS

TENUTA PISTONE MAGNETICO TIPO MPS

Descrizione

La guarnizione tipo MPS è stata studiata sia per pistoni di cilindri pneumatici compatti a corsa breve sia per il semplice e doppio effetto. L'elemento di guida è sulla guarnizione stessa. Appositi interstizi e notches creano spazi per trattenere il grasso lubrificante mantenendo elevata la scorrevolezza del pistone nel tempo. Il magnete è alloggiato all'interno tra le due guarnizioni contrapposte. Specifiche progettuali personalizzate sono a disposizione per soluzioni alternative.

Limiti d'impiego

Pressione: < 20 bar
 Velocità: < 1 m/s
 Temperatura: da -40° C a +90° C
 Fluidi: aria con o senza lubrificazione, oli e grassi minerali (v. tabella 3 a p. 14)

Materiale

Materiale standard poliuretano a 90 Shore A.
 Codice materiale standard: Bo
 Materiale alternativo poliuretano a 85 Shore A.
 Codice materiale alternativo: Ao

Montaggio

Eliminare tutti gli spigoli vivi e le bave nella sede del pistone per evitare di compromettere la guarnizione. Il montaggio si effettua per accavallamento della guarnizione sul diametro del pistone, che deve essere sagomato esattamente come da disegno della tabella dimensionale MPS. Eseguire uno smusso sulla camicia del cilindro.

MPS TYPE MAGNETIC PISTON SEAL

Description

The MPS seal has been specifically designed either for pneumatic compact short stroke cylinders and single/double effect cylinders. The guiding element is integrated on the seal. Specific notches keep the lubricant grease maintaining a sliding effect on the piston for long time. The magnet is located between the two opposed gaskets. For specific needs or problems, our technical office is at your complete disposal with tailor-made solutions.

Technical data

Pressure: < 20 bar
 Speed: < 1 m/s
 Temperature: from -40° C up to +90° C
 Fluids: air with or without lubrication, mineral oils or grease
 (see table 3, page 14)

Material

Standard polyurethane 90 Shore A.
 Standard compound reference: Bo
 Alternative polyurethane 85 Shore A.
 Alternative compound reference: Ao

Assembling

It is important to remove flashes or cutting edges in the housing to avoid damages. The installation is made by overlapping the seal on the piston diameter. Warning: the piston must be correctly shaped according to the drawing of the MPS dimensions table. The bore must present a lead-in chamfer.

MPM

PISTONE MAGNETICO TIPO MPM

Descrizione

Il pistone magnetico MPM è stato studiato per cilindri pneumatici a doppio effetto dove esiste la necessità di controllare la corsa del pistone/stelo tramite la presenza di un anello magnetico all'interno del pistone stesso. Il pistone magnetico MPM, rispetto ai tradizionali pistoni monoblocco in NBR, ha il vantaggio di mantenere il pistone perfettamente allineato alla sede grazie alla presenza dell'anello guida. Inoltre, le due tenute contrapposte in poliuretano garantiscono la buona scorrevolezza del pistone e mantengono il cilindro internamente pulito, anche in presenza di aria lubrificata.

Il pistone MPM è composto da:

- 2 anelli di tenuta in poliuretano contrapposti fra loro
- 2 anime in alluminio per il corpo centrale del pistone
- 1 elemento magnetico in plastoferrite
- 1 guida per mantenere allineato il pistone
- 1 o-ring in NBR.

I suddetti articoli possono essere forniti assemblati oppure singolarmente.

Limiti d'impiego

Pressione: < 20 bar

Velocità: < 1 m/s

Temperatura: da -40° C a +90° C

Fluidi: aria lubrificata e non, grasso, ecc. (v. tabella 3 a p. 14)

Materiale

Tenute pistone in TPU polietere 85 Shore A e 90 Shore A;
Alluminio ANTICORODAL 6082 per corpo centrale pistone; magnete ANISOTROPICO (plastoferrite orientata); resina acetica additivata PTFE per elemento guida; NBR a 70 Shore A per o-ring interno.

Montaggio

Il montaggio è molto semplice poiché il pistone magnetico è fornito già assemblato nelle sue componenti. Eliminare tutti gli spigoli vivi e/o bave di lavorazione dello stelo per evitare di danneggiare l'o-ring interno.

MAGNETIC PISTON TYPE MPM

Description

The MPM magnetic piston, has been specifically designed for double effect pneumatic cylinders, where it is necessary to control the piston/rod stroke, by a magnetic rings, inside the piston. The MPM magnetic piston, compared with conventional mono-bloc pistons in NBR, has another relevant advantage, thanks to the piston wear ring, which maintains the piston perfectly aligned with the bore. Moreover, the two opposed polyurethane piston seals, ensure a good sliding effect on the piston and maintain the system clean even in the presence of lubricated air.

The MPM magnetic piston, is composed by the following elements:

- 2 Polyurethane seals, opposing each other
- 2 Aluminium parts, for central elements of the piston
- 1 magnetic element in Plastoferrite
- 1 wear ring to maintain the piston axially aligned
- 1 NBR O-ring.

The above mentioned items could be supply assembled or each single part.

Technical data

Pressure: < 20 bar

Speed: < 1 m/s

Temperature: from -40° C up to +90° C

Fluids: Air (lubricated or not), grease, etc. (see table 3, page 14)

Material

Piston seals available in TPU Polyether 85 Shore A and 90 Shore A; Aluminum ANTICORODAL 6082 for central elements; ANISOTROPIC Magnetic Ring (oriented plastoferrite); Acetal Resin (POM) PTFE reinforced for wear ring; NBR 70 Shore A for o-ring.

Assembling

The installation is very easy because the Kit is available already preassembled. It is important to remove flashes or cutting edges on the rod to avoid damages on the O-ring.

SPS

TENUTA PISTONE A MOLLA TIPO SPS

Descrizione

Realizzata per tenuta pistone di cilindri pneumatici, la guarnizione tipo SPS è utilizzabile anche per valvole pneumatiche, se gli ingombri lo permettono. Le ridotte dimensioni delle sedi consentono un'esecuzione di lavorazione macchina semplice. Il profilo simmetrico, costituito da una tenuta arrotondata al centro sul labbro dinamico e due sporgenze sul labbro statico, ne facilita il montaggio. La particolare forma a molla rende il sistema molto scorrevole anche a bassa pressione.

Limiti d'impiego

Pressione: < 20 bar
 Velocità: < 1 m/s
 Temperatura: da -40° C a +90° C
 Fluidi: aria con o senza lubrificazione, oli e grassi minerali (v. tabella 3 a p. 14)

Materiale

Materiale standard poliuretano a 90 Shore A.
 Codice materiale standard: Bo
 Materiale alternativo poliuretano a 85 Shore A.
 Codice materiale alternativo: Ao

Montaggio

Eliminare tutti gli spigoli vivi e le bave sulla camicia per evitare di compromettere la guarnizione.
 Eseguire uno smusso sulla camicia del cilindro.

SPS TYPE SPRING PISTON SEAL

Description

The SPS rod seal has been designed for pneumatic cylinder applications. The SPS can also be used for pneumatic valves where the overall dimensions allowed. Moreover a shorter machining of the system can be obtained thanks to the reduced overall dimensions. The profile is rounded in the middle of the dynamic lip and it has two projections on the static lip. This symmetric shape allows easier installation. The special spring shaped profile ensures high flexibility in the system even at low pressure.

Technical data

Pressure: < 20 bar
 Speed: < 1 m/s
 Temperature: from -40° C up to +90° C
 Fluids: air with or without lubrication, mineral oils or grease
 (see table 3, page 14)

Material

*Standard polyurethane 90 Shore A.
 Standard compound reference: Bo
 Alternative polyurethane 85 Shore A.
 Alternative compound reference: Ao*

Assembling

It is important to remove flashes or cutting edges in the housing to avoid damages. The bore must present a lead-in chamfer.

SPS / N

TENUTA PISTONE A MOLLA TIPO SPS/N

Descrizione

Realizzata per tenuta pistone di cilindri pneumatici, la guarnizione tipo SPS/N è utilizzabile anche per valvole pneumatiche dove gli ingombri lo permettono.

Le ridotte dimensioni delle sedi consentono un'esecuzione di lavorazione macchina veloce e semplice.

Il profilo simmetrico ne facilita il montaggio.

La particolare forma a molla rende il sistema molto scorrevole anche a bassissima pressione.

Limiti d'impiego

Pressione: < 12 [bar]

Velocità: < 1 [m/s]

Temperatura: da - 30 °C a +100 °C mescola NBR
da -15 °C a +150 °C mescola FKM

Fluidi: aria lubrificata, grassi e oli minerali (v. tabella 3 a p. 14)

Materiale

Il materiale standard è NBR 80 Shore A.

A richiesta materiale FKM 75 Shore A.

Codice materiale standard: N1

Montaggio

Eliminare spigoli vivi e le bave per non danneggiare la tenuta al momento del montaggio. Eseguire uno smusso sulla camicia del cilindro.

SPS/N TYPE SPRING PISTON SEAL

Description

The seal type SPS / N is a piston seal for pneumatic cylinders.

The SPS/N can also be used for pneumatic valves where the overall dimensions allowed.

The reduced dimensions of the seat allows fast and simple machining operations.

This symmetric profile allows easier installation The special spring shape ensure a system sliding even at very low pressure.

Technical data

Pressure: < 12 [bar]

Speed: < 1 [m/s]

Temperature: from - 30 °C to +100 °C mescola NBR
from -15 °C to +150 °C mescola FKM

Fluids: Lubricated air, grease and mineral oils (see table 3, page 14)

Material

Standard material is NBR 80 Shore A.

On demand material FKM 75 Shore A

Standard compound reference: N1

Assembling

It is important to remove flashes or cutting edges in the housing to avoid damages. The bore must present a lead-in chamfer.

PLF

TENUTA PISTONE TIPO PLF

Descrizione

Nata per ridurre attrito e limitare l'ingombro nel pistone, la tenuta PLF (Pneumatic Low Friction) è una guarnizione per pistoni pneumatici a semplice e a doppio effetto.

Il particolare profilo sfrutta la pressione dell'aria per fare tenuta sia assialmente sia radialmente. Può lavorare a bassa (0,20 Bar) e alta pressione (20 Bar) ed evita lo stick-slip in fase di partenza e durante il movimento alternativo.

Grazie al particolare profilo presenta ridotta usura nel tempo.

Limiti d'impiego

Pressione: < 20 bar

Velocità: < 1 m/s

Temperatura: da -40 °C a +90 °C

Fluidi: aria (con o senza lubrificazione), fluidi e oli a base minerale
(v. tabella 3 a p. 14)

Materiale

Standard: Poliuretano 85 Shore A

Codice materiale: Ao

Montaggio

Il montaggio avviene in cava chiusa e prima di procedere si consiglia di lubrificare con grasso minerale.

È importante togliere le bave di lavorazione che danneggerebbero la tenuta durante il montaggio. Eseguire uno smusso sulla camicia del cilindro.

PISTON SEAL TYPE PLF

Description

The PLF seal "Pneumatic Low Friction" is a single or double effect piston seal, created for Low Friction Working and to have limited dimension of the groove. The particular profile use air pressure, to seal both axially and radially.

It can work at low pressure (0,20 Bar) and high pressure (20 Bar).

No Stick-Slip is in the starting process or during the reciprocating movement.

Thanks to the particular design has a low wear over time.

Technical data

Pressure: < 20 bar

Speed: < 1 m/s

Temperature: from -40 °C to +90 °C

Fluids: air (lubricated or not), mineral-based fluid and oil.
(see table 3, page 14)

Material

Standard: Polyurethane 85 Shore A

Material code: Ao

Assembling

The assembling is in closed groove .

Important is to eliminate burrs, that during the assembly, will damage the seal. Before the assembling is recommended to lubricate with mineral grease. The bore must present a lead-in chamfer.

MPP

PISTONE MONOBLOCCO TIPO MPP

Descrizione

Il pistone monoblocco tipo MPP è realizzato in gomma nitrilica di durezza 75 Shore A vulcanizzata su inserto metallico.

Si usa normalmente in applicazioni pneumatiche nei cilindri a semplice e a doppio effetto. Il profilo a labbri di tenuta arrotondati facilita lo scorrimento ed evita il fenomeno di stick-slip. La camera portalubrificante tra i due labbri di tenuta garantisce nel tempo la linearità al movimento assiale. In caso di carichi radiali forti, i distanziali in senso dello scorrimento autoallineano il pistone alla camicia. Nella parte interna, il pistone presenta da entrambi i lati alcuni bassorilievi che facilitano il primo distacco durante l'inversione di marcia.

Dati tecnici

Pressione: < 20 bar
Velocità: < 1 m/s
Temperatura: da - 30° C a + 100° C
Fluidi: aria (lubrificata e non), grasso, ecc.(v. tabella 3 a p.14)

Materiale

Il materiale utilizzato è la combinazione di gomma NBR 75 Shore A con inserto acciaio. È possibile realizzare il pistone in FKM per impieghi ad alte temperature.

Montaggio

Eliminare spigoli vivi all'imbocco camicia-cilindro per evitare di compromettere la guarnizione. Ingrassare il pistone prima del montaggio. Eseguire uno smusso sulla camicia del cilindro.

Importante: si raccomanda di utilizzare rondella di fissaggio sbavata e arrotondata

MONOBLOCK PISTON TYPE MPP

Description

The MPP type mono-block piston type MPP is made of NBR nitrile rubber hardness 75 Shore A vulcanized on a metal insert.

It is normally used in pneumatic applications, in single and double effect cylinders. The profile with rounded edges improves the sliding and avoids Stick-Slip. The groove leads lubricant through the two sealing lips, ensuring the axial movements linearity for long time.

The sliding direction spacers, self-align piston and sleeve in case of heavy radial loads. The piston presents, on both sides of the internal part, some grooves helping breakaway during the first reverse gear.

Technical data

Pressure: < 20 bar
Speed: < 1 m/s
Temperature: from - 30° C up to + 100° C
Fluids: air (lubricated or not), grase, etc. (see table 3, page 14)

Material

The material used is a combination of nitrile rubber NBR 75 Shore A and steel insert. For high temperature application we could also provide FKM compound instead of NBR compound.

Assembling

Remove sharp edges at the Bore-Cylinder entry to avoid seal damages. Grease the piston before installation. The bore must present a lead-in chamfer.

Important: deburred and rounded fixing washer is recommended

MPC

PISTONE MONOBLOCCO CORTO TIPO MPC

Descrizione

Il pistone corto monoblocco tipo MPC è realizzato in gomma nitrilica di durezza 75 Shore A vulcanizzata su inserto metallico.

Si usa normalmente in applicazioni pneumatiche nei cilindri a semplice e a doppio effetto. Il profilo a labbri di tenuta arrotondati facilita lo scorrimento ed evita il fenomeno di stick-slip. La camera tra i due labbri di tenuta creata come distanziale garantisce nel tempo la linearità al movimento assiale.

La parte interna, sporgente rispetto ai labbri, funge da ammortizzo e presenta da entrambi i lati alcuni bassorilievi che facilitano il primo distacco durante l'inversione di marcia.

Dati tecnici

Pressione: < 20 bar
 Velocità: < 1 m/s
 Temperatura: da - 30° C a + 100° C
 Fluidi: aria (lubrificata e non), grasso, ecc.(v. tabella 3 a p.14)

Materiale

Il materiale utilizzato è la combinazione di gomma NBR 75 Shore A con inserto acciaio. È possibile realizzare il pistone in FKM per impieghi ad alte temperature.

Montaggio

Eliminare spigoli vivi all'imbocco camicia-cilindro per evitare di compromettere la guarnizione.

Ingrassare il pistone prima del montaggio. Eseguire uno smusso sulla camicia del cilindro.

Importante: si raccomanda di utilizzare rondella di fissaggio

SHORT MONOBLOCK PISTON TYPE MPC

Description

The MPC type short mono-block piston type MPP is made of NBR nitrile rubber hardness 75 Shore A vulcanized on a metal insert.

It is normally used in pneumatic applications, in single and double effect cylinders. The profile with rounded edges improves the sliding and avoids Stick-Slip. The groove leads through the two sealing lips as a spacer, ensuring the axial movements linearity for long time.

The internal part of the piston is larger than the lips and its function is cushioning and presents, on both sides, some grooves helping breakaway during the first reverse gear.

Technical data

Pressure: < 20 bar
 Speed: < 1 m/s
 Temperature: from - 30° C up to + 100° C
 Fluids: air (lubricated or not), grase, etc. (see table 3, page 14)

Material

The material used is a combination of nitrile rubber NBR 75 Shore A and steel insert.

For high temperature application we could also provide FKM compound instead of NBR compound.

Assembling

Remove sharp edges at the Bore-Cylinder entry to avoid seal damages.

Grease the piston before installation. The bore must present a lead-in chamfer.

Important: fixing washer is recommended

PSN

TENUTA PISTONE TIPO PSN

Descrizione

La tenuta pistone tipo PSN è stata studiata per impieghi pneumatici e oleodinamici e può essere montata anche su pistone di tipo monoblocco grazie alla sua elasticità. La sua caratteristica principale è l'eccezionale scorrevolezza che consente l'impiego anche con fluidi a basso potere lubrificante come aria e acqua.

Innumerevoli test hanno confermato l'assenza di estrusione del profilo anche con passaggio della tenuta sui fori di drenaggio.

Dati Tecnici

Pressione: da 1 a 20 bar
 Velocità: < 4 m/s
 Temperatura: - 30° C a + 120° C,
 Fluidi: aria lubrificata e non (v. tabella 3 a p. 14)

Materiale

Il materiale utilizzato per l'elemento di tenuta è un tecnopolimero ad alta elasticità, mentre si utilizza un o-ring in NBR 75 Shore A per l'elemento energizzante.

In alternativa, per la tenuta si può utilizzare PTFE rinforzato carbografite, mentre per l'elemento energizzante o-ring in materiali quali HNBR o FKM.

Montaggio

Il montaggio avviene in sede anulare in modo elastico.

Eliminare le bave di lavorazione meccanica e lubrificare la tenuta con grasso. Eseguire uno smusso sulla camicia del cilindro.

PSN TYPE PISTON SEAL

Description

The PSN type piston seal has been designed for both pneumatic and hydraulic applications.

Due to its elasticity can also be assembled on monoblock piston type.

Its main characteristic is an exceptional smoothness that allows to use this seal even with low lubricity fluids such as air and water.

many tests have given positive results as regards the absence of extrusion of the profile even with the passage of the seal on the drainage holes of the system.

Technical data

Pressure: da 1 a 20 bar
 Speed: < 4 m/s
 Temperature: from - 30° C up to + 120° C
 Fluids : air (lubricated and not)
 (see table 3, page 14)

Material

The material of the sealing element is a polymer with high elasticity, while as for the energizing element using an O-ring in NBR 75 Shore A.

Alternative material should be use for sealing PTFE filled carbon-graphite, while for the element energizing O-ring materials such as HNBR or FKM.

Assembling

Installation is in elastic way in anular housing.

Remove the burrs mechanical and lubricate the seal with grease. The bore must present a lead-in chamfer.

ISA

FASCE DI GUIDA PER STELO TIPO ISA

Descrizione

Per evitare il contatto diretto tra lo stelo e la testata del cilindro, e tra il pistone e la camicia, che nella maggior parte dei cilindri pneumatici è di alluminio, si inserisce una fascia di guida tipo ISA che tiene guidato tutto il sistema.

Le fasce di guida sono stampate con un materiale autolubrificante, non abrasivo e studiato per favorire uno scorrimento lineare. Il profilo della guida presenta smussi interni ed esterni che facilitano il montaggio di stelo e pistone.

Limiti d'impiego

Velocità: < 1 m/s

Temperatura: da - 40° C a + 115° C

Materiale

Resina poliacetalica modificata.

Grazie all'aggiunta di particolari additivi il materiale è molto scorrevole e non abrasivo.

Codice materiale standard: R3

Vantaggi

- ottimo rapporto prezzo/prestazioni
- basso effetto stick-slip
- buona resistenza alla compressione.

Montaggio

Grazie alle guide tagliate il montaggio si esegue facilmente.

Nota: sezione tecnica guide p.158

ISA TYPE ROD GUIDE RING

Description

The ISA type rod guide ring is used to avoid direct contact between cylinder head and rod, and between piston and sleeve, since for the main part of the pneumatic cylinders are made of aluminium. It's also used to lead all the system.

The guide rings are moulded in non-abrasive and self-lubricant material, especially studied to improve the linear sliding.

The profile presents chamfers both sides for easier installation of rod and piston.

Technical data

Speed: < 1 m/s

Temperature: from - 40° C up to + 115° C

Material

Non abrasive modified Polyacetalic resin with additives improving the sliding.

Standard compound reference: R3

Advantages

- excellent price/performance ratio
- low stick-slip effect
- good compressive strength.

Assembling

The assembling can be easily done since the wear ring is cut.

Note: wear rings technical section p.158

NG

NASTRO GUIDA IN PTFE TIPO NG

Descrizione

Il nastro guida NG in politetrafluoroetilene caricato carbografite è fornito in rotoli dai quali si ricavano guide intercambiabili con quelle in materiale termoplastico. Applicate su stelo e su pistone, le guide hanno come caratteristiche principali la precisione dello spessore e la quasi assenza di attrito. Per la loro inerzia chimica sono compatibili con molti fluidi e possono essere con o senza smussi di invito.

Limiti d'impiego

Velocità: < 15 m/s

Temperatura: da -50°C a +160°C con punte a 200°C

Fluidi: molti fluidi essendo un materiale con inerzia chimica elevata (v. tabella 3 a p. 16)

Materiale

Il materiale è un politetrafluoroetilene (PTFE) con caricato carbografite
Codice materiale: TC LCG3030

Montaggio

Grazie alle guide tagliate il montaggio si esegue facilmente.

Nota: sezione tecnica guide p.158

NG TYPE PTFE WEAR TAPE

Description

NG carbon-graphite filled PTFE tape is supplied in rolls.

By cutting them is possible to obtain interchangeable guides to replace thermoplastic material.

They can be used for rods or pistons.

Thanks to the properties (thickness accuracy, low friction and chemical resistance) are compatible with many fluids.

They can be with or without chamfers.

Technical data

Speed: < 15 m/s

Temperature: from -50°C to +160°C peaks till 200°C.

Fluidi: many fluids as a material with high chemical inertia
(see table 3, page 16)

Material

The material is carbon-graphite filled PTFE.
Compound reference: TC LCG3030

Assembling

The assembling can be easily done since the wear ring is cut.

Note: wear rings technical section p.158

LWA

RASCHIATORE LEGGERO TIPO LWA

Descrizione

Il raschiatore leggero tipo LWA è studiato per tenere pulite le bussole a sfera nelle unità di guida. A contatto con alberi cementati o rettificati nella parte interna, il raschiatore alloggia nella parte esterna sul diametro della bussola mentre l'aggancio è garantito da una gola (tipo quella di un seeger per esterno) in cui si inserisce il gradino del raschiatore.

La lavorazione meccanica di facile esecuzione e l'ingombro minimo hanno esteso il campo di applicazione anche nei cilindri pneumatici. Il labbro molto flessibile del raschiatore non pregiudica la scorrevolezza dell'unità di guida.

Limiti d'impiego

Velocità: < 4 m/s

Temperatura: da - 40° C a + 90° C

Materiale

Il materiale utilizzato è un poliuretano che resiste molto bene all'usura e benissimo alle basse temperature mantenendosi sempre flessibile. Materiale standard poliuretano a 90 Shore A. Codice materiale standard: Bo

Montaggio

Eliminare tutti gli spigoli vivi e le bave nell'alloggiamento del raschiatore.

Si consiglia di ingrassare il sistema. Lo stelo deve avere uno smusso di invito.

LWA TYPE LIGHT WIPER

Description

The LWA type light wiper is designed for the ball-bushings cleaning in the guide systems.

The internal part is in contact with hardened or ground shafts.

The external part is located the outside diameter of the bushing and the hanging is ensured by a groove (similar to a circlip for external use) where the wiper step is inserted.

The field of applications has been enlarged to the pneumatic cylinders thanks to the very simple mechanical execution and the reduced overall dimensions.

The highly flexible wiper lip does not interfere with the sliding of the guide system.

Technical data

Speed: < 4 m/s

Temperature: from - 40° C up to + 90° C

Material

Our polyurethane is very resistant to wear and is excellent at low temperature due to its high flexibility. Standard polyurethane 90 Shore A. Standard compound reference: Bo

Assembling

Remove cutting edges and flashes in the scraper housing.

We recommend greasing the system. The rod must have a lead-in chamfer.

BWA

RASCHIATORE BIDIREZIONALE TIPO BWA

Descrizione

L'elemento di tenuta tipo BWA ha il profilo di una guarnizione a labbri asimmetrici combinato con un raschiatore.

Alloggiato in un'unica sede, presenta ingombri ridotti e minor tempo di esecuzione della sede.

Limiti d'impiego

Pressione: < 20 bar

Velocità: < 1 m/s

Temperatura: da - 40° C a + 90° C

Fluidi: aria con o senza lubrificazione, oli e grassi minerali (v. tabella 3 a p.14)

Materiale

Materiale standard poliuretano a 90 Shore A.

Codice materiale standard: Bo

Materiale alternativo poliuretano a 85 Shore A.

Codice materiale alternativo: Ao

Montaggio

La sede dove alloggia il raschiatore non deve presentare spigoli vivi o bave che compromettano la durata in esercizio.

BWA TYPE BI-DIRECTIONAL WIPER

Description

The BWA sealing part combines an asymmetrical lip seal profile with a wiper.

Since it is installed in a single groove, the BWA seal has several advantages:

- reduced overall dimensions
- faster construction of the groove.

Technical data

Pressure: < 20 bar

Speed: < 1 m/s

Temperature: from - 40° C up to + 90° C

Fluids: air with or without lubrication, mineral oils or grease
(see table 3, page 14)

Material

Standard polyurethane 90 Shore A.

Standard compound reference: Bo

Alternative polyurethane 85 Shore A.

Alternative compound reference: Ao

Assembling

Remove cutting edges and/or flashes from the housing where the wiper has to be installed in order to minimise seal wear during operation.

PIW

RASCHIATORE BIDIREZIONALE TIPO PIW

Descrizione

Il raschiatore bidirezionale PIW (Pneumatic Innovative bidirectional Wiper) è stato studiato per eliminare le perdite dovute a imperfezioni di lavoro nelle sedi delle testate dei cilindri pneumatici (fig.45). Testate che possono essere in materiale plastico rinforzato con fibre di vetro o in alluminio fuso lavorate a utensile. La particolare forma del profilo, con rilievi sul lato statico esterno, elimina completamente le perdite dovute a tagli, segni di lavorazione d'utensile, ovalizzazioni e conicità di sforno nelle testate in plastica.

Limiti d'impiego

Pressione: < 20 bar
 Velocità: < 1 m/s
 Temperatura: da - 40° C a + 90° C
 Fluidi: aria (lubrificata e non) grassi minerali (v. tabella 3 a p.14)

Materiale

Il materiale utilizzato è un poliuretano di durezza 90 Shore A. Codice materiale: Bo

Montaggio

Il montaggio avviene in cava chiusa. Si consiglia di eliminare spigoli vivi e bave per non danneggiare la tenuta durante la fase di montaggio.

Fig.55:

- 1- distanziali stabilizzatori per evitare back-pumping
- 2- rilievi per vincere le imperfezioni delle sedi
- 3- ampio raggio per creare effetto molla utile alle basse pressioni
- 4- raggio sul labbro dinamico per diminuire l'attrito di primo distacco
- 5- raggiatura per rendere maggiormente elastico il labbro statico

Fig.55 - Pic.55:

BI-DIRECTIONAL WIPER TYPE PIW

Description

The bi-directional wiper PIW "Pneumatic Innovative bidirectional Wiper" is design in order to eliminate the leakage due to the imperfection of the working in the groove of pneumatic cylinder head (Pic.45). The pneumatic head cylinder can be made in plastic material filled with glass fibers or cast aluminum machined. The particular shape of the profile, with reliefs on the external static side completely eliminates leakage due to: cut, signs of machine tool, ovality and taper draft in plastic head cylinders.

Technical data

Pressure: < 20 bar
 Speed: < 1 m/s
 Temperature: from - 40° C up to + 90° C
 Fluids: air (lubricate or not) mineral grease (see table 3, page 14)

Material

The material used is Polyurethane with hardness 90 Shore A. Material code: Bo

Assembling

The assemblin is on closed groove. Eliminate sharps and burrs to avoid damage the seal during the assembling.

Pic.55:

- 1- stabilizers spacers to avoid back-pumping
- 2- reliefs to win imperfection of the groove
- 3- big radius to create spring effect usefull at low pressure
- 4- radius on dynamic lip to decrease friction breakaway
- 5- radius to make more flexible static lip

Fig.56 - Pic.56:

Pneumatic

BWS

RASCHIATORE BIDIREZIONALE CON GRADINO TIPO BWS

Descrizione

Il raschiatore tipo BWS è ottenuto dalla combinazione di una guarnizione a labbri asimmetrici e un raschiatore. Sul labbro di tenuta presenta una raggiatura che lo rende molto scorrevole e sul lato statico un gradino ridotto che facilita il montaggio soprattutto per diametri piccoli. La parte raschiante ha un labbro molto sottile per non influenzare il primo distacco nel movimento del cilindro.

Limiti d'impiego

Pressione: < 20 bar
 Velocità: < 1 m/s
 Temperatura: da - 40° C a + 90° C
 Fluidi: aria con o senza lubrificazione, oli e grassi minerali (v. tabella 3 a p. 14)

Materiale

Materiale standard poliuretano a 90 Shore A.
 Codice materiale standard: Bo
 Materiale alternativo poliuretano a 85 Shore A.
 Codice materiale alternativo: Ao

Montaggio

La sede che alloggia il raschiatore deve essere priva di spigoli vivi o bave che compromettano la durata in esercizio. Per impieghi gravosi, in presenza di disallineamenti o fuori centro con diametri di stelo superiori a $\varnothing 16$ mm, è consigliato un montaggio in sede con tutta la base del raschiatore e non il semplice aggancio con il solo gradino.

BWS TYPE BI-DIRECTIONAL WIPER WITH STEP

Description

The BWS wiper combines an asymmetric lip seal profile with a wiper. On the sealing lip the BWS has a radius allowing greater smoothness and on the static side the reduced size step facilitates installation, especially for small diameters. The scraping part has a very thin lip so as not to influence the stick-slip effect in the cylinder movement.

Technical data

Pressure: < 20 bar
 Speed: < 1 m/s
 Temperature: from - 40° C up to + 90° C
 Fluids: air with or without lubrication, mineral oils or grease
 (see table 3, page 14)

Material

Standard polyurethane 90 Shore A.
 Standard compound reference: Bo
 Alternative polyurethane 85 Shore A.
 Alternative compound reference: Ao

Assembling

Remove cutting edges and/or flashes from the housing where the wiper has to be installed in order to minimise seal wear during operation.

Warning: for heavy duty applications showing misalignments or imbalance and with diameters bigger than $\varnothing 16$ mm, it's recommend to hang the base of the wiper to the housing and not only to the step.

BWH

RASCHIATORE BIDIREZIONALE CON GANCIO TIPO BWH

Descrizione

La forma particolare e il profilo del raschiatore con aggancio tipo BWH e la sede completamente aperta, con una fresatura sulla parte laterale, consentono un rapido montaggio in automatico e in manuale e una sostituzione del raschiatore altrettanto facile.

Lo speciale profilo, che combina tenuta e raschiatore, è molto robusto e consente allo stelo anche significativi disallineamenti senza espulsioni dalla sede.

Inoltre, la forma dei labbri statici impedisce la penetrazione di impurità nel cilindro.

Limiti d'impiego

Pressione: < 20 bar

Velocità: < 1 m/s

Temperatura: da - 40° C a + 90° C

Fluidi: aria con o senza lubrificazione, oli e grassi minerali (v. tabella 3 a p. 14)

Materiale

Materiale standard poliuretano a 90 Shore A.

Codice materiale standard: Bo

Materiale alternativo poliuretano a 93 Shore A.

Codice materiale alternativo: Co

Montaggio

Durante il montaggio è consigliato lubrificare la parte interna del raschiatore, mentre occorre evitare di lubrificare la parte esterna e la cava per il pericolo di espulsione dalla sede.

Eliminare tutti gli spigoli vivi e le bave nella sede per facilitare il montaggio e non danneggiare la guarnizione durante l'inserimento.

BWH TYPE BI-DIRECTIONAL WIPER WITH HOOK

Description

The main characteristic of the hooked profile of the BWH wiper is to enable easy and fast installation into a complete open housing, both automatically and manually.

The groove is completely open with a lateral milling, which allows the wiper to be replaced easily.

The special profile combining seal and wiper is very strong and allows important rod misalignments without any danger of ejection from the seat.

Moreover, the static lips profile keeps the cylinder free from outside impurities.

Technical data

Pressure: < 20 bar

Speed: < 1 m/s

Temperature: from - 40° C up to + 90° C

Fluids: air with or without lubrication, mineral oils or grease
(see table 3, page 14)

Material

Standard polyurethane 90 Shore A.

Standard compound reference: Bo

Alternative polyurethane 93 Shore A.

Alternative compound reference: Co

Assembling

The wiper should be lubricated internally during installation. The external lubrication of the wiper and housing is not recommended due to the ejection risk of the wiper. It is important to remove cutting edges and flashes in the housing to prevent damages of seal during assembling.

BWH/N

RASCHIATORE BIDIREZIONALE CON GANCIO TIPO BWH/N

Descrizione

La particolare geometria del raschiatore BWH/N, senza aggancio e con anima metallica vulcanizzata all'interno, per sede completamente aperta, favorisce il montaggio in automatico. Il bassorilievo creato in sede, porta seeger, garantisce la non espulsione del raschiatore. Estremamente semplice anche la sostituzione in caso di manutenzione. Lo speciale profilo, che combina la tenuta e il raschiatore in un'unica soluzione, impedisce la penetrazione di impurità nel cilindro.

Limiti d'impiego

Pressione: < 16 [bar]
 Velocità: < 1 [m/s]
 Temperatura: da -30°C a +100°C per la versione in NBR
 da -15°C a +200°C per la versione in FKM
 Fluidi: aria lubrificata, grassi e oli minerali (v. tabella 3 a p. 14)

Materiale

Il materiale standard è NBR 75 Shore A colore nero. In alternativa FKM 75 Shore A di colore marrone.
 Codice materiale standard: NG

Montaggio

Per il montaggio: inserire il raschiatore e posizionare il seeger nell'apposita nicchia. Si consiglia di lubrificare la sede e togliere gli spigoli vivi creati da lavorazione meccanica.

BWH/N TYPE BI-DIRECTIONAL WIPER WITH HOOK

Description

The special geometry of the wiper BWH/N, without hanging, with vulcanized metal core inside, for completely open groove, improve the assembling. The grooved seat circlip holder, avoids the scraper ejection. The replacement is also very simple during maintenance. The special profile combining seal and wiper in a single solution, keeps the cylinder free from outside impurities.

Technical data

Pressure: < 16 [bar]
 Speed: < 1 [m/s]
 Temperature: from -30°C to +100°C for NBR version
 from -15°C to +200°C for FKM version
 Fluids: lubricated air, grease and mineral oils (see table 3, page 14)

Material

Standard material is NBR 75 Shore A black colour. In alternative FKM 75 Shore A brown colour.
 Compound reference: NG

Assembling

We suggest assembling as follows:

- insert scraper
- place circlip in the niche.

It is recommended to lubricate the seat and remove the sharp edges originated by the machining.

CUP

MEMBRANE PER SCARICO RAPIDO TIPO CUP

Descrizione

Le membrane per scarico rapido tipo CUP sono utilizzate sulle valvole per aumentare la velocità di traslazione nei cilindri a semplice e doppio effetto e per depressurizzare velocemente nel caso di svuotamento di serbatoi o altro.

Limiti d'impiego

Pressione: da 0,5 a 10 [bar]

Temperatura: da -40°C a +90°C

Fluidi: aria secca o lubrificata (se lubrificata si consiglia olio ISO VG32).

Materiale

Materiale standard poliuretano a 90 Shore A.

Codice materiale standard: Bo

Per impieghi superiori a 90°C il materiale utilizzato è poliuretano per alte temperature (135°C)

Codice materiale standard: Go

Montaggio

Il montaggio avviene in sede aperta.

CUP TYPE MEMBRANES FOR QUICK EXHAUST VALVES

Description

The membranes for quick exhaust valves are used on CUP type for faster travel speed, in single and double acting cylinder, and to depressurize quickly if you want to empty the tanks or otherwise.

Technical data

Pressure: from 0,5 to 10 [bar]

Temperature: from -40°C to +90°C

Fluids: dry or lubricated air (in case of lubricated is recommended to use oil ISO VG32).

Material

Standard polyurethane 90 Shore A.

Standard compound reference: Bo

for applications above 90°C, the material used is polyurethane for high temperatures (135°C)

Code standard material: Go

Assembling

The assembly is in open groove.

It is recommended to lubricate with mineral grease.

Poliuretano colato

Cast polyurethane

Poliuretano colato

Cast polyurethane

Descrizione

Lo stampaggio per colata utilizza resine poliuretane liquide bicomponenti, molto fluide, formate da un componente chiamato Poliolo ed uno chiamato Isocianato che funge da catalizzatore. Miscelati in un rapporto stechiometrico danno origine ad un prodotto compatto ma allo stesso tempo molto flessibile.

Nel caso specifico delle guarnizioni, i componenti utilizzati possono essere a base polietere o poliestere, e in vari metodi quali MDI, TODI o PPDI. Le guarnizioni stampate con il metodo a colata hanno una elevata elasticità, una elevata resistenza alle pressioni e un'ottima resistenza all'abrasione. I motivi che inducono ad utilizzare questo metodo sono molteplici:

- Ridurre i costi rispetto a stampi tradizionali a iniezione.
- Possibilità di eseguire diametri molto grandi
- Possibilità di eseguire forme complesse e con sottosquadri

Description

Cast molding uses two-component liquid polyurethane resins, very fluid, formed by a component called Polyol and one called Isocyanate which acts as a catalyst.

Mixed in a stoichiometric ratio they generate a compact but at the same time very flexible product. In the specific case of seals, the components used can be polyether or polyester based, and in various methods such as MDI, TODI or PPDI.

The seals molded with the cast method have a high elasticity, a high resistance to pressure and an excellent resistance to abrasion.

The reasons for using this method are many:

- Reduce costs compared to traditional injection molds.
- Possibility to execute very big diameters
- Possibility to perform complex shapes with undercuts
